

This handout is printed periodically with funds provided by the Minnesota Book Center. The handout does not represent any manufacturer, distributor, or retail outlet. The University cannot be held responsible for any error or change in price, description, or availability with respect to any product or service.

The Minnesota Book Center will not accept returns or exchanges for opened hardware and will accept defective merchandise for exchange only at the option of the vendor.

# Apple Macintosh Computers

**Computer and Information Services  
Information Systems**

**152 Shepherd Laboratories  
Minneapolis, MN 55455  
(612) 626-4276**

**8/18/93**

**Copyright © 1993  
University of Minnesota**

The University of Minnesota has contracts with many computer hardware and software companies and through the U of M Bookstores provides discounted prices to departments and eligible faculty, staff and students. Hardware products from Apple Computer, Hewlett-Packard, IBM, Zeos and many others are available and software products from Adobe, Aldus, Borland, Claris, Lotus, Microsoft, Symantec, WordPerfect and many others for Macintosh, DOS and Windows are available.

This handout covers microcomputer hardware that is part of the University of Minnesota's Microcomputer Discount Program. We strongly suggest that you spend some time using the microcomputers you are considering to be sure they are useful for the tasks you want them to perform. As part of this process, you should assure yourself that the software you plan to use will work with the microcomputer you plan to buy.

Currently, no University departments have plans for requiring or recommending use of any of these microcomputers in their programs and courses.

**How Do I Order?** You place your order at the Computer Desk in the Minnesota Book Center in Williamson Hall. The clerks at the Computer Desk are not prepared to answer technical questions, so if you are unsure about your purchase, please call or visit the Microcomputer HelpLine (see below).

**Eligibility:** University of Minnesota departments and eligible individuals may purchase through the Microcomputer Discount Program. Eligible individuals are: any student enrolled at the University of Minnesota in a course of study leading to a degree (students with one or more

hours are eligible), any faculty member and any permanent staff member. To prove eligibility, students must show a current fee statement, faculty must show their faculty ID card or a letter from their department and staff members must show their ID card or a letter from their department.

Individuals (whether faculty, staff, or students) may purchase one computer, a desktop or portable system, per manufacturer, in a one-year period. They may also purchase one printer per manufacturer in a one-year period. There is no quantity restriction on departmental purchases. Equipment purchased is for the individual's educational use and may not be resold for one year. Violation of the agreement is grounds for disciplinary action by the University

**Payment:** Departments pay with an Institutional Voucher (Form IV). Please make sure that your IV has the proper Area and Org numbers, has the necessary signature and has ORTTA approval if necessary. Faculty and staff can pay with a personal check, or charge to their VISA, Discover, or MasterCard account (the account must be in the name of the purchaser). Students must pay with a cashier's check, bank check, money order, or cash, or charge to their VISA or MasterCard account (the account must be in the name of the purchaser). Students can write checks up to \$500 only.

**Violations:** Faculty and staff who misuse the discount program will be disciplined to the full extent of University rules and regulations and will be required to return the equipment to the bookstore. The bookstore will refund the purchase price of the microcomputer equipment

pro-rated by 10% (ten percent) for each month since the microcomputer equipment was purchased. Faculty, staff, and students who violate the terms of the discount program will be prohibited from making any further microcomputer equipment purchases through the bookstore and will have their microcomputer lab access privileges suspended for one year. Students who violate the Purchase Agreement will have a hold put on their records. The hold can be removed only by returning the microcomputer equipment to the bookstore.

**Changing or Canceling an Order:** If you wish to change or cancel an order, send a note, signed by the person who placed the order, to: Computer Desk, c/o Minnesota Book Center, 160 Williamson Hall, 231 Pillsbury Dr. SE, Minneapolis, MN 55455. The note should include your name, phone number, item in question, order number, and the date the equipment or software was ordered. In addition, to speed up processing, send a copy of the order.

**HelpLine:** This write-up is published by Computer and Information Services (CIS). If you have microcomputer questions or problems, you can call the CIS Microcomputer HelpLine at 626-4276 (dial MA-MICRO) between 9:00 and 4:00, Monday through Friday, or you can visit one of our HelpLine locations in person. Locations and hours are: 152 Shepherd Labs (9-4, Monday through Friday); 99B Coffey Hall (9-12 Monday and Friday, 1-4, Wednesday); 93 Blegen Hall (1-4 Tuesday and Friday, 9-12 Thursday).

**Free Training Available:** The CIS Microcomputer HelpLine offers orientation sessions for all new computer owners. These free sessions cover the basics of setting up and using your machine. To register for a training session,

## Memory and Memory Upgrades

*Prices of memory chips can fluctuate rapidly. Prices and availability are subject to change without notice.*

To purchase memory with a Mac order, go to the Book Center. To have memory installed after purchase, call Eng. Serv. (625-1595).

**Central Processing Unit**

The CPU (Central Processing Unit) is the “brain” of the computer and is often called the microprocessor. It is the part that performs the actual computations and acts as controller of all the activities a computer does— such as pay attention to what you type on the keyboard, find files on your disk, display things on the monitor, and pull data out of memory to be acted on.

Physically, the CPU is a single large chip that is plugged into a circuit board inside the computer. If you take the cover off the computer, you can easily find it because it is usually the largest chip in there.

When considering the different CPU chips, look at several features and functions: internal and external bus, clock speed, memory addressing, cache, and math coprocessing capabilities.

**Internal and External Bus**

A bus transfers information between different components of the computer. The larger the bus, the more information it can transport. Buses can be of different widths, measured by the number of bits they can handle at one time. Typical buses are 16- or 32-bits wide. A 32-bit bus can handle twice the information that a 16-bit bus can handle in the same amount of time.

The internal bus connects different sections of the CPU chip itself. The external bus connects the CPU to memory (RAM/random access memory) and other devices. It is also called the I/O (Input/Output) bus or the data bus.

**Clock Speed**

The CPU uses an internal clock to time and coordinate the execution of instructions. Clock speed refers to the speed at which this clock ticks and is measured in units called megahertz (MHz), which is one million ticks per second. Ultimately, computation speed is determined by clock speed and CPU type. In

general, a more powerful CPU running at a slower clock speed gives better performance than a less powerful CPU running at a faster clock speed.

**Memory: RAM**

When you use an application, the operating system copies the program and its data from your disk into RAM (Random Access Memory). RAM is actually a sequence of storage locations, each with its own address. You could think of RAM as a huge wall of post office boxes. Each box has its own number. The more digits you can use, the more boxes you can identify. (The only restriction is that, for our analogy, each box can hold only one piece of mail at a time.) Similarly, the more bits a computer can use to address memory, the more memory locations it can identify.

**Cache Memory**

Some CPUs have special memory called cache. Cache memory is much faster to access than regular memory; it’s also much more expensive. Cache means “keep for later use.” Most programs tend to need certain segments of memory over and over. Systems with cache load data into the cache from main memory and then feed it to the CPU as requested. Various algorithms try to keep information in the cache that the CPU is most likely to request. When the CPU requests information that hasn’t been copied into cache, the processor must wait until the cache fetches the data it didn’t have. The larger the cache, the more likely it will already contain what the CPU needs.

**Math Coprocessing**

Math coprocessing is a special set of functions that are optimized to perform very high-speed floating-point arithmetic. These functions can be built into the CPU itself, or they can come on their own chip.

Not all software will take advantage of the

presence of math coprocessing capabilities. Programs that tend to use math coprocessors are spreadsheets, CAD applications (Computer Aided Design), statistical packages, and font-scaling utilities (especially if they use PostScript).

**Motorola CPUs**

All Macintoshes come with CPUs manufactured by Motorola. The first Motorola processor was the 68000, followed by the 68020, the 68030, and the 68040. Each of these chips can be manufactured to operate at different clock speeds. (Unlike the Intel chips, which incorporate the clock speed into the CPU designation, such as the 386-16 or the 386-20, the names of Motorola chips give no hint of their clock speed.) The following table shows Motorola CPUs, their speeds, and the Macintoshes that use them. (The table does not include those Macs that are no longer sold as part of the Microcomputer Discount Program.)

<b>Motorola CPU</b>	<b>Clock Speed in MHz</b>	<b>Macintosh</b>	
68030	16	Classic II	
	16	Color Classic

had full 32-bit address registers. However, the 68000 uses only 24 of those bits to address 16 megabytes of address space. Of that 16 MB of address space, half is directly available as RAM (Random Access Memory), the system memory used by software programs. The other 8MB are allocated for ROM (Read Only Memory) and I/O (Input/Output).

Although the 68000 uses 32-bit data registers to perform computations, it uses a 16-bit data bus to retrieve data from memory. Thus it requires two fetches from memory to fill a register.

This handout is printed periodically with funds provided by the Minnesota Book Center. The Handout does not represent any manufacturer, distributor, or retail outlet. The University cannot be held responsible for any error or change in price, description, or availability with respect to any product or service. The Minnesota Book Center will not accept returns or exchanges for opened hardware and will accept defective merchandise for exchange only at the option of the vendor.

68020

The original Macintosh II and the original Mac LC were the only Macintoshes to use the 68020 chip.

The 68020 is a full 32-bit processor (32-bit registers and 32-bit data path) that can utilize a companion chip, the 68851, to handle memory management.

68030

The 68030 merges the 68020 processor and the 68851 memory management unit (MMU). It uses full 32-bit addresses, allowing direct access to 4 gigabytes (4 billion bytes) of addressable space. The 68030 also uses a 32-bit data bus, allowing it to fill one 32-bit register with just one fetch from memory.

The 68030 also has two 256-byte caches, a RAM cache, and an instruction caches. These caches speed up processing because they eliminate the wait that occurs in the execution of instructions in the 68020. (More detailed information about memory will be available in an upcoming article in our Computer Basics series.)

#### *MMU: Memory Management Unit*

The MMU supports A/UX (Apple's implementation of the UNIX operating system).

The MMU also supports virtual memory if you are running System 7.0. Virtual memory allows you to run more applications simultaneously than your RAM would otherwise allow by treating part of your hard disk as additional RAM. (System 7 users turn virtual memory on or off by using the *Memory* option in the Control Panel's folder.)

68040 and 68LC040

In the 68040, the RAM and instruction caches are expanded to 4K each. Speed is further enhanced by reducing the average number of clock cycles per instruction.

The 68040 chip also incorporates the functions of a math (floating-point) coprocessor. In prior Motorola CPUs, math coprocessing capability could be obtained by using a separate coprocessor chip.) The math coprocessor on the 68LC040 chip is disabled.

680XX Comparisons

Each Motorola processor provides enhanced performance over its predecessor.

- The 68000 has 32-bit registers with a 16-bit data bus.
- The 68020 is a full 32-bit processor, i.e. both registers and bus are 32-bit.
- The 68030 merges memory management functions into the CPU itself and adds data and instruction caches.
- The 68040 incorporates a floating-point coprocessor and has larger caches.
- On the 68LC040 the floating-point coprocessor is disabled.

Clock speed provides another point of comparison. A 68030 running at 25MHz will execute instructions 25% faster than one running at 20MHz.

The 68000 is the only Motorola processor with a 16-bit data bus. All the others have a 32-bit data bus, enabling them to retrieve data from memory twice as fast as the 68000. Thus a 68030 running at 20MHz will process data around five times faster than a 68000 running at 8MHz. (You get a fivefold speed increase because of improvements to the clock speed and the data bus. The 68030 is two and a half times as fast because of the clock speed, then twice as fast as that because of the data bus).

Motorola Summary

CPUs offer different features. Some features affect the speed of processing,

such as clock speed, caches, and data bus size. Other features, such as integrated coprocessing, affect the functionality of the chip.

Which CPU you select depends on what you plan to do with the software you will be using. Simple word processing does not require a very fast CPU. However, if you are designing and reformatting elaborate desktop publishing documents, you will probably want all the speed you can get. Simple line art can be drawn with any CPU; complex graphics or spreadsheet software can benefit from, and may even require, a floating-point coprocessor.

Finally, you must decide what you want to do with the computer, find software that will enable you to do it, then select the computer that will run that software. Don't buy anything less than what the software requires, but also don't spend a lot of money for speed that you will never need or functionality that you will never use.

32-Bit Clean ROMs and MODE32 or 32-bit System Enabler

If you are running System 7 and your machine has 32-bit clean ROMs (i.e., the LC, IIsi, IICI, IIfx, or later), you will be able to use more than 8 megabytes of RAM only if you turn on 32-bit addressing. You turn this on by selecting the *Memory* icon in the *Control Panel* folder and then clicking the ON button.

The Mac SE/30, II, IIcx, and IIX do not have 32-bit clean ROMs. This means that, even though you can physically put up to 68 (II) or 128 (SE/30, IIX, IIcx) megabytes in these computers, the system can access only 8 megabytes of memory. The Microcomputer HelpLine has two memory management utilities which will enable these Macs to access all the memory that will fit. MODE32 or Apple's 32-bit System Enabler (for System 7.1) can be copied from the *System Software* folder on the Mac Information Server which is accessible through the campus internet, the Microcomputer HelpLines, and many of the

This handout is printed periodically with funds provided by the Minnesota Book Center. The Handout does not represent any manufacturer, distributor, or retail outlet. The University cannot be held responsible for any error or change in price, description, or availability with respect to any product or service. The Minnesota Book Center will not accept returns or exchanges for opened hardware and will accept defective merchandise for exchange only at the option of the vendor.

## Public Computer Facilities.

---

### Expansion Slots

Expansion slots can be used for internal modem cards, accelerator cards, network cards, and so on. Macintoshes differ in how many slots (if any) they have, and of what sort. Please note that there are currently five different kinds of expansion boards: 020 Direct Slot, 030 Direct Slot, Processor Direct Slot, IIx Direct Slot, and NuBus. The Centris 610 uses only 7" NuBus cards. Not every board will work in every computer. Make sure you choose the appropriate type of board!

---

#### Floppy Disk Drives

All Macintoshes available under the discount program (except the Duo 210 and 230) come with the FDHD (Floppy Disk High-Density) drive. This floppy disk drive allows you to format, read, and write 400K, 800K, and 1.4 megabyte Macintosh disks. In addition, using the Apple File Exchange Utility you can read, write, and format 720K and 1.4 megabyte IBM PS/2 disks (both DOS and OS/2 Standard Edition), and 800K Apple II ProDOS disks.

---

#### Hard Disk Drives

---

#### CD-ROM Drives

---

#### Interfaces

- two RS-232/RS-422 serial ports for modems and printers.

- an AAUI-15 Ethernet connector is an option on the Centris 610 and 650, or standard on the Quadra 800 and 950.
- one (Classic II and LC III) or two Apple Desktop Bus Connectors for connecting the mouse and the keyboard.
- an external drive interface for connecting an external floppy disk drive (Classic II only).
- an audio port. All current Macintoshes have a sound-out port and a sound-in port.
- a SCSI or HDI-30 SCSI (Small Computer System Interface) port for connecting SCSI devices such as a hard disk, scanner, and the LaserWriter IISC.

In addition to the above interfaces, the LC III, the IIfx, the Centris 610 and 650, the Quabras, the PowerBooks 160/160c and 180/180c, and the Duo Dock have a video port.

---

#### Other Hardware

**Macintosh IIfx Cache Card:** The Cache Card features 32K of 25-nanosecond SRAM (static RAM) to speed performance. This card can be used on the older IIfx only. All new IIfx configurations came with the cache card already installed.

**Macintosh Centris 610 NuBus Adapter:** The Centris 610 has a single expansion slot that accepts an adapter for either a NuBus or processor-direct slot card. To install any 7" NuBus card, you need the Macintosh Centris 610 NuBus Adapter.

**Macintosh PowerBook 2400 Data/Fax Modem:** This low-power modem fits inside the PowerBook 100, 140, 145, 160, 170, and 180, and operates at 2400, 1200, or 300 baud. It can also send faxes at 9600 baud.

**Macintosh PowerBook Express Modem:** This low-power modem comes in two models, one fits inside the PowerBook 160 and 180, and the other in the Duo 210 and 230, and operates up to 14,400 bps. It can also send or receive faxes at 9600 baud.

This handout is printed periodically with funds provided by the Minnesota Book Center. The Handout does not represent any manufacturer, distributor, or retail outlet. The University cannot be held responsible for any error or change in price, description, or availability with respect to any product or service. The Minnesota Book Center will not accept returns or exchanges for opened hardware and will accept defective merchandise for exchange only at the option of the vendor.

The Minnesota Book Center will not accept returns or exchanges for opened hardware and will accept defective merchandise for exchange only at the option of the vendor.

- 1 The LC III also supports third-party and VGA monitors.
- 2 The Centris 610 and 650, the Quadra 800, and the Workgroup Server 95 also support a wide range of third-party displays, including some 19-inch, VGA, SVGA, NTSC, and PAL monitors. You will need an appropriate adapter cable.
- 3 The 21" Color Display requires a third-party video NuBus card to display 16.7 million colors.
- 4 The PowerBooks 165, 165c, 180, and 180c also support some VGA and SVGA displays.

The Minnesota Book Center will not accept returns or exchanges for opened hardware and will accept defective merchandise for exchange only at the option of the vendor.

Warranty and Repair Service

## Warranty Service

Engineering Services is an "authorized" warranty service center for most microcomputer products manufactured by Apple, IBM, NeXT and Zenith; for Rodime hard disks; and for most printers manufactured by Hewlett-Packard. Engineering Services works as a team with the Microcomputer Center and the Book Center to provide service beginning the day your equipment is picked up. If items are missing from your shipment, contact the Electronics Desk at the Book Center. If you have trouble with the equipment but are not sure if it is a hardware, software, or setup problem, your first call or visit should be to the Microcomputer HelpLine/lab <sup>626-4276</sup> at 152 Shepherd Labs. If a hardware problem is suspected, call the Engineering Services service line, <sup>625-1595</sup>. Engineering Services will provide free carry-in hardware warranty service. They need a copy of your warranty papers showing what you bought, by model and serial number, and when it was picked up. For Apple products purchased at the Book Center, the paper you need is the copy of the Book Center Order Form you receive when you pick up your computer. Be sure you know when your warranty ends and where your

warranty papers are kept! These papers can be worth hundreds of dollars!

Engineering Services also offers departments the convenience of on-site warranty service (within a 5 mile radius) at a cost of \$25 to cover travel expenses not authorized under manufacturer's warranties. On-site warranty is provided at no charge to departments with on-site contracts on their micros.

## Post Warranty Maintenance Service Options

Engineering Services offers three levels of post warranty contract service as well as non-contract Time and Materials service. The choice between contract service and T & M service involves many factors such as cost, risk, response, and convenience. Over the life of microcomputer products, maintenance costs will typically range from about 20% to more than 50% of the purchase price of the product depending on many factors. A service contract is an insurance policy and covers almost any problem with your Macintosh except accident or abuse. You receive priority service at a guaranteed annual price with a single payment.

Under Time and Materials service, you are charged for parts and labor.

The most popular and cheapest contract service is Carry-In. Equipment delivered to the shop one day is usually ready for pickup the next day. Some departments use Campus Courier service for pickup and delivery of their equipment.

Two levels of on-site service are available (within a five mile radius). Under both levels, response is an average of four working hours. With Level I service, Engineering Services provides loaner equipment if your unit cannot be repaired within a reasonable period.

If you choose to extend your protection through a service contract, you can avoid both a gap in coverage and an inspection of your equipment by contacting Engineering Services before your warranty expires.

This handout is printed periodically with funds provided by the Minnesota Book Center. The Handout does not represent any manufacturer, distributor, or retail outlet. The University cannot be held responsible for any error or change in price, description, or availability with respect to any product or service. The Minnesota Book Center will not accept returns or exchanges for opened hardware and will accept defective merchandise for exchange only at the option of the vendor.

The Minnesota Book Center will not accept returns or exchanges for opened hardware and will accept defective merchandise for exchange only at the option of the vendor.

## Special Orders

The Minnesota Book Center Computer Desk (625-3854) may be able to special order items not on this price list.

## Purchasing Department

University Departments can send a Requisition to the Purchasing Department to order computer related equipment. If you have never ordered anything from the Purchasing Department before, the How to Purchase Equipment and Supplies from Non-University Vendors section of The Paper Cycle may help you.

## Other Discounts

ComputerLand offers a 25-31% discount from the list prices for University staff and students. Call Stuart Lipsky at 612/550-3235. The Micro HelpLine has ComputerLand's price list.

Whenever you contact a vendor, mention your University of Minnesota affiliation and ask if they offer discounts.

# Networks

**Apple LocalTalk Network:** The Apple LocalTalk Local Area Network (LAN) is used to share resources among several Macs that are located reasonably close together. You can connect up to 32 devices on one AppleTalk network. The maximum total length of the network is 300 meters. The most common use of the AppleTalk LAN is to share a resource such as a LaserWriter. To connect a device to the network you need an Apple LocalTalk (or Farallon PhoneNET) connector. An Apple LocalTalk connector kit consists of a LocalTalk connector, a two-meter length of cable, and a cable extender. One end of the Apple LocalTalk connector plugs into the device (on the Mac it plugs into one of the serial connectors). The other end of the connector has two sockets into which you plug the Apple LocalTalk cable. If you want a long run of network cable, use an Apple LocalTalk cable extender to connect two shorter runs of cable together. The Apple LocalTalk Cable Kit consists of a ten-meter length of cable and an Apple LocalTalk cable extender.

**PhoneNET:** An alternative to Apple LocalTalk connectors is Farallon's PhoneNET connectors. PhoneNET is functionally equivalent to LocalTalk network hardware but is somewhat less expensive. Rather than using Apple LocalTalk cable, PhoneNET connectors use inexpensive telephone wire.

**Apple EtherTalk:** The EtherTalk card is an Apple Macintosh II hardware product; the EtherTalk card is an Ethernet interface you use to connect the Mac II, IIX, IISI, ICX, IICI, IIVX, or IIFX directly to an Ethernet local area network. The EtherTalk card comes with software to use an Ethernet network as a high speed AppleTalk network. This product is Apple's answer to the complaint that there should be a faster AppleTalk network. (Ethernet runs at 10 MBits/second; the classic Apple Local-Talk network runs at 230 KBits/second.) To use an EtherTalk network, you connect the cables and then use the Networks option in the  menu's Control Panel to select between EtherTalk and AppleTalk. After it's all set up, using EtherTalk is completely transparent; that is, existing software should work without modification.

When you use an EtherTalk card to communicate over an Ethernet network, the messages (datagrams) sent over the network are structured to conform to the AppleTalk protocol. Sending AppleTalk datagrams works well for departmental networks, but the campus-wide Ethernet network is designed to handle TCP/IP-protocol datagrams. This means that EtherTalk may not work across parts of the campus-wide network because some parts of the network may not expect to handle AppleTalk datagrams. A/UX (UNIX), which runs on the Mac II, does support the TCP/IP protocols with the EtherTalk card. To support

the TCP/IP protocols in addition to AppleTalk, you can pick up a copy of the MacTCP network drivers from the Computer and Information Services HelpLine.
