

Assassin Help

Program: Assassin

Synopsis: Assassin terminates a specified application program and optionally will execute a new application. Used in situations where a resource is used by two programs like swapping between a FAX program and a **TERMINAL** program using the same comm port.

Usage : ASSASSIN [/F:File_Name] [/M:module_name] [/Help] [/R] [/X:Command]

Command Line options:

/f:File_name This option specifies that the running application with the file name **File_name** is to be terminated. The **/f** option should not be used with the **/m** option.

/m:Module_name This option specifies that the running application with the module name **Module_name** is to be terminated. The **/m** option should not be used with the **/f** option.

/x:Command This option specifies a program to execute along with command line parameters (see example). This option must be the last option in the options list.

/r This option specifies that upon termination of the **/x:Command**, the application terminated by either a **/f** or **/m** option will be reexecuted.

/h or /? Either of these options will display the **About** box.

Example :

ASSASSIN /f:fax.exe /r /x:terminal

In this example, the currently running program **fax** will be terminated, then the application **terminal** will be executed. Finally, when **terminal** quits, **fax** will be reexecuted.
