

SCHED
NAME

sched - Job scheduler.

SYNOPSIS
load=sched.exe

DESCRIPTION
Insert into the section **[windows]** in the file **win.ini**:
load=sched.exe

Sched runs idle waiting for jobs. If a job is passed to **sched**, **sched** changes to the directory specified in the job, and runs the program (with optional parameters) specified in the job as a child process. If the last specified parameter is the **&** symbol, the program will run minimized.

Sched tries to find the program in the current directory, in the Windows directory, in the Windows system directory and finally in the directories specified in the environment variable **PATH**.

The environment variable **TEMP** must have been set to your directory to be used for temporary files.
