

Known bugs and problems

126476_PixelRule.tiff ↗

The following is a list of problems that I know of as of July 1993. Note that I have no immediate plans to fix any of these. I'm just listing them so we all know that they are known problems!

197843_paste.tiff ↗ This does not process the height or width table that is found in some fonts. While it should convert fonts like this properly, the resulting character dimensions may not be on spot.

374126_paste.tiff ↗ PostScript expects the missing/undefined character to have the same width as a space (The missing character is what you see on the Mac when you type a character that isn't defined in the font. Usually a hollow rectangle shape). This utility doesn't attempt to compensate for this, and so if you type a missing character, your cursor placement on the paragraph will become offset from where you'd think it should be. Deleting the missing character will fix this.
