Installing fonts

126476_PixelRule.tiff ¬

These are merely tips or suggestions for how you might install the font files created by Convert FONT.   You should consult your NeXT documentation for any definitive information.

295706_PixelRule.tiff ¬

934853_CheckMark.tiff ¬   If you have a font installation utility, you may be able to use it to install the font.

68285_CheckMark.tiff ¬   If you have no font installation utilities, install the font by dragging it into an appropriate font folder (see below).   If it doesn't automatically appear in applications that you launch *after* installing the font, then run the `buildafmdir` program from a Terminal window.

270604_CheckMark.tiff ¬   The buildafmdir program takes a directory as an argument.   So, after opening a window in the Terminal app, type something like:

```
buildafmdir ~/Library/Fonts
```

Note that you should use the name of the directory that you installed the font into (not necessarily ~/Library/Fonts).

44559_CheckMark.tiff ¬   There are three standard places to install fonts into: /NextLibrary/Fonts, /LocalLibrary/Fonts or ~/Library/Fonts   (The ~ indicating your home folder). /NextLibrary/Fonts contains fonts distributed by NeXT, and you probably will not want to install fonts in there. /LocalLibrary/Fonts is where you would install the font if you want other users to use it.   If you install the font into ~/Library/Fonts, then you will be the only user that will be able to use it.   If you are using a multi user machine, you may not have permission to install in anything but ~/Library/Fonts.
