

Inspector Panels

257522_PixelRule.tiff ↵

The Primary Inspector Panel

This panel's primary job is to allow you to manipulate and control the image you've loaded into GraphicsWorkshop. To see how to select this panel from the menus, click [here](#)
;MenusAndPanels.rtf;Inspectors;↵

Conversion

Pops up a panel for doing image conversions. The buttons should be set such that clicking on Apply Conversion nothing will happen. To change what will happen select the resultant image depth you'd like in the upper portion, and then select the flags you'd like applied to the image. The Alpha button, if set will add an alpha plane to the image, or strip that plane. The invert button will reverse the data in the image. When converting to one bit images, the alpha channel will be stripped.

Cropping and Compositing

This will allow you to crop and composite images. There's a

possibility these could be broken up in the future, but until I actually implement them, they'll remain the same.

Gamma Correction

Allows you to change the strength and weaknesses of colors over the color spectrum in a image. This basically allows you to run images thorough color filters.

Image Enhancements

Will allow you to enhance images, detect edges, and perform other image manipulation algorithms.

Information

Prints information about the image, such as pixel depth, number of colors, name, size, etc^{1/4}
