

Chapter 12

Equation

MenuEquation.tiff ↵

Open... (o)

Brings up the standard NeXT Open panel for you to pick the equation (.eqn) files you wish to edit or examine.

New (n)

Creates a new equation window.

Save (s)

Brings up the standard NeXT Save panel so that you can save your current equation to an .eqn file on disk.

- **Note**

Remember that EquationBuilder's native file format is Encapsulated PostScript. This is a very handy feature. EquationBuilder's .eqn files can be drag-and-dropped into other applications just as if they were .eps (Encapsulated PostScript) files. If an application does not properly accept .eqn files, use the Workspace Manager to change the file extension to .eps and try again. This is also handy for previewing EquationBuilder files using the Workspace Manager's Contents inspector and for other preview applications that work with .eps files.

Save As... (S)

Brings up the standard NeXT Save panel and allows you to specify a *new* file name and

directory under which to save your equation. Note that any subsequent editing of the equation will occur under its new filename.

Revert to Saved (u)

Allows you to return to the last saved version of your equation. Note that this command will wipe out any changes you have made since the last time you saved your equation to disk, so use with caution!

Close

Closes the current equation window. If the equation has been edited since the last time it was saved, you will be given a chance to save changes before closing.
