Gravity affects the way in which objects interact with each other in the drawing. Individual points, as well as the endpoints of lines, will be attracted by other lines and points. If you are sizing or moving a line, its endpoints will be attracted by existing lines and points. If you are placing a point, it will also be attracted by existing lines and points. Endpoints, points, and intersections of lines attract strongly. Lines themselves attract weakly. The best way to get the feel for it is to try it out.

You may change the sensitivity, or range, of gravity (and turn it on and off) by bringing up the *Gravity Inspector*, which is located under the **Tools** menu. The sensitivity is measured in pixels. Gravity is on by default.
