

Document Description:

The *Document Description* panel provides a multi-media text scroll view in which documentation for the current simulation can be added. The text scroll view allows the user to drag in graphics and other document files or attachments from the *Workspace*.

paste_8.tiff ↵

When graphics or attachments are dragged from the *Workspace* into the text scroll

view, they can be copies of the original file which will then be part of the *FieldSimulator* data file. Linked files will be called from their original directory when they are selected in the data file. If the user links files and then makes a copy of the *FieldSimulator* data file, those attachments are not copied with it. This means that if the *FieldSimulator* data file was copied onto another network that does not know about the original directory of the attachment, the linked files will no longer be part of the data file.

The *Locked* button will lock the description so that another user cannot change it.

This text scroll view is a multi-media text object written by Joe Freeman at NeXT which supports graphics and file attachments.
