

Axis:

paste_4.tiff ↵

If the y-axis is selected, then the offset is the graph x-coordinate of the y-axis. In this case, the y-axis is located 300 units from the origin. For the default y-axis, the offset would be the same as the minimum x-axis limit.

If the x-axis is selected, then the offset corresponds to the y position of the x-axis.

The user can change the width of the selected axis, choose whether or not the axis has an arrow and make the axis the default axis.

Note: the axes are automatically scaled to match the grid. To change the range of an axis, select the plot and change the grid settings.
