

Data Set Inspector:

This inspector allows the user to create, open or modify a data set for the document listed in the upper left of the panel:

paste_0.tiff ↵

To create a new data set, type a name in the *Title* text field, then click the *Add* button. The name of the new data set will appear in the scroll text field in the upper left of the panel. The name will also appear as the title of the scroll text field in the right half of the panel. Data points may be added or removed using the text fields in the Point box. Additionally, space delimited data may be typed or copied into the scroll text field in the right half of the panel. If text is typed directly into this field, it must be parsed in order to add it to the data set (the data set must be parsed if any data is deleted from the view

as well.) Select *Parse Data* to add the newly typed or copied data to the data set or to remove data from the view. Select *Revert* to delete any text in the view that has not been parsed.

To open an existing data set, click the *Open* button. This will call up a standard *Open* panel. Any data file with the extension *.xydata* will be recognized. Once open, the data set can be modified in the same manner as described above.

Caution, the *Remove All Data Sets* button will remove all the data sets from the current

document even if they have been modified.
