

# RadioMatrixAssociation

by Craig Federighi, EO Development Team  
and Mai Nguyen, NeXT Developer Support

## Overview

This is an example of a custom association. This example uses a custom datasource, but it can be easily adapted to use a real database datasource.

## Program Organization

### User Interface

By selecting a new value in the radio button matrix, the choice is automatically updated in the tableview, and fed to the data source. Upon a new fetch, you can verify that the tableview reflects the last selected choices.

### Major Classes in the Application

AppController	A cover class to initialize the data source of person objects and handle the controller fetch operations.
DataSource	A custom data source class (from SHLExamples).
Person	A simple NSObject class to represent a person's data
RadioAssociation	A custom association for matrices of radio buttons.
