

(void)unableToFaultWithPrimaryKey:(NSDictionary \*)aKey entity:(EOEntity \*)anEntity databaseChannel:  
(EODatabaseChannel \*)aChannel

unableToFaultWithPrimaryKey:entity:databaseChannel: is called whenever the Enterprise Objects Framework is unable to resolve a to-one fault to a single database record. The Framework attempted to fetch the record from entity anEntity using primary key aKey. The attempted fetch occurred on database channel aChannel. If your enterprise objects do not implement this method, an NSObjectNotAvailableException will be raised in the event that this situation arises.
