

initWithData:type:

Getting data as a type dataForType:

(NSData *)dataForType:(NSString *)typeString

Returns the value of the receiver as a data object in the format indicated by typeString. This method is used to convert a custom type to an NSData object for writing to the database. For example, this code excerpt produces an image in Tagged Image File Format:

valueType (EOAttribute class)

initWithData:(NSData *)data type:(NSString *)typeString

Initializes the receiver to contain the value in data. typeString, if non-nil, indicates the format of the contents of data for example, "TIFF". Returns self.

This method is used to create a custom type from an NSData object read from the database.

valueType (EOAttribute class)
