

Fill Options

You can choose to fill text with a **solid fill** or with **lines** by using the radio buttons to indicate your choice.

Both fills have a **gray-scale** range; you can choose the starting and ending gray levels and TextArt will fill in the intermediate levels based on the number of steps you have selected. You can choose the direction of the gray scale changes for both line and solid fills: top to bottom, left to right, or counter-clockwise (radial) with radio buttons.

You can set the number of lines for a line fill or the number of gray level transitions for solid fill with the **Steps** slider and text field. If you are going to print your image on a high resolution typesetter, you may want to increase the number of steps even though you won't be able to see a difference on the screen.

When you are using a line fill, you can specify the thickness of the lines with the **Fill Line Width** slider and text field.

Helpful Hints: You can get the effect of bottom to top, right to left, or clockwise fills by reversing the start gray and end gray levels.
