

Layering Objects

Each graphic (whether single or grouped) has a front to back position in the Layout Board window. Imagine that each graphic is on a sheet of acetate, and that the window displays all of these sheets layered one on top of the next.

When a graphic is created, it's placed on top of the others. You can move a selected graphic in front of all other graphics by choosing **Bring to Front (command-f)** from the Layering submenu of the Layout menu. This will cause the graphic to be drawn or printed after all the other graphics. You can move a selected graphic underneath all the rest by selecting **Send to Back (command-F)**.

To move a graphic one position forward, select **Bring Closer (command-+)** from the Layering submenu. To move a graphic one position further back, select **Send Further (command--)**.
