Subject: Some hopefully useful code snippets...

Two useful things I came up with over the last couple of weeks. Hope they help somebody.

/* HostPicker Method

Assumptions:

- * you have an instance variable named hostField where you store the hostname.
 - *every hostname in every netinfo subdomain is accessible to your system.
 - *add libni_s.a to your libraries in ProjectBuilder.
 - *Connect a button to this and voila!
- */

```
- pickHostName:sender
{
    id    thePanel = [NIOpenPanel new];
    [thePanel setListTitle: "Machine Names"];
    [thePanel setPanelTitle: "Machine Name Picker" ];

    if ([thePanel runModal] == NX_OKTAG)
    {
        const char *fullDomain = [thePanel directory];
        if (fullDomain && *fullDomain){
            [hostField setStringValue: (char *)fullDomain];
            //[self changeHostName:self];
            //optional, add this method if you want to trigger the change.
        }
    }
    return self;
}
```
