To try to make up for all the traffic I've generated lately, here's an improved version of the script I posted yesterday.   I hacked this out in a few minutes:

ztiff ¬
     ztiff

It adds the following flags:

- -i   list the compression scheme for each file specified
- -l   compress each file with LZW
- -j   compress with JPEG

-p   compress with Packbits
-n   uncompress (compress with None)

You have to specify exactly one flag, then the file(s) you want to work on, like this:

    ztiff -i Foo*.tiff Bar.tiff

Thanx,
Michael
