I took these from Xox.app and cleaned them up.

Stealing from good sources is everything, to paraphrase T.S. Eliot, the unwedded mother of object-oriented poetry.

These icons were stolen fair and square and are here redistributed in the same spirit.
(Maybe we should have an Icon source scavenger contest: "I can name that icon's antecedent in three cycles or less...")

Sorry for the bandwidth for those of you paying by the byte, and also to those of you in the monochromatic

modality...

Please enjoy.

Jupiter came from Sam Streeper's new game, Xox.app, which can be found at sonata. I haven't had much time to play with it, but I sneaked inside the app wrapper to grab this one.

Here are some icons that I grabbed some time ago from the next-Icon archives.
(These originally came from Sam Streeper's Xox.app)
I converted them to 48x48 and anti-aliased them:

Here are a couple more from Xox, as well as Jupiter and Ganymede, not cleaned up here but just scaled to 48 x 48 (with WetPaint).

...and the ever-munificent Sam Streeper (Xox's author) kindly permits these (or any part of Xox) to be used "any way you like".

2 celestial bodies down (including the earth), 8 to go (including the moon)... (but Ganymede and Io can be passed off as other planets or earth's moon)

Enjoy,

Charles
