

Create Packages

Contents:

;WhatsNew_3.0.rtf; ;*What's New for 3.x*

Create_3.1.pkg - The actual Create Application. Install it in /LocalApps for use by everyone or ~/Apps on a standalone machine.
NOTE: if you are using NEXTSTEP 3.2, install
./NS_3.2/Create_3.1_for_NS_3.2.pkg instead.

Create_Aux.pkg - This directory has extra documents and clip art not included in the .pkg distribution. Install it into your Library.

manual; ;**Manual**; ;**CR_Online_Manual.pkg** - This package contains the Create manual online in a DataPhile database. It needs to be installed inside the Create.app App Wrapper, and it will add a new menu item, *Online Manual...* to the Info menu. Also install the demo version of DataPhile on this CDROM if you don't already have

DataPhile.

manual;¬Manual;¬CR_Filter.pkg - This package contains a program which allows you to drag and drop Create docs into other apps and automatically convert them to EPS. However, Mail.app is broken in NS 3.3, so Mail crashes when you drop in a Create document. This is worth installing if you want OOE level 2 compliance and are willing to put up with the Mail.app bug. It can also be run from the command line to batch convert Create documents into RTF, ascii, EPS or TIFF.

CR_French.pkg - Ce paquet contient la version fran aise. Installez-le si vous d sirez utiliser Create en fran ais.

CR_German.pkg - The German language localization package.
(NOTE - this is still 'in Progress')
