Appendix A   Limitations of NCSA CompositeTool

Overview

This appendix lists some Sun-related constraints on NCSA CompositeTool version 1.1.

Running CompositeTool on the Sun Workstation under SunOS 4.x, presents some limitations, including the following:

- CompositeTool behaves as though it is running from the present working directory from which you have invoked it (for example, your home directory). You must take this fact into account when specifying files. To avoid any possible confusion, use full pathnames when specifying files.

- On Sun systems with a monochrome overlay plane, the startup logo will only flash briefly on the screen unless you run SunView with the -8 bit_color_only option.
