/channel channel [passwd]  join a channel [with password]
/cmdchar c                 changes the command-prefix (default /) to the
given character
/cping nick                shows response time for 'nick' in seconds

/ctcp nick command       issues a CTCP command. Do /ctcp nick clientinfo for
more info.
            sound sndname

plays the sound 'sndname' at 'nick's computer
            sound
```

```
displays the list of available sounds on 'nick's computer
            xdcc list
```

```
displays the list of available files on 'nick's computer
            xdcc version
```

```
shows the xdcc version (currently 1.0)
            xdcc
send #
```

```
asks 'nick' to send file number # to your computer
              action

= /me
              finger       shows the idle time and/or email address of a user
              source       shows where to obtain ircle.
              version      shows the (ircle) version.
              clientinfo   shows all ctcp commands of a client.
              userinfo     displays the userinfo field of a user.
              ping         pings a user to see he/she is still there
              face get     gets a face file from a user.
              face exist   shows if a user has a face file⏎
              time          shows the local time of a user.
```

video stream opens a video window from the target to you.

/date   display date and time

/dcc command nick [filename]   issues a DCC command (explained below)

Valid commands for /dcc are:

chat nick - requests CHAT connection for nick or answers such a request.
send nick - send a file.
tsend nick - send a text file.
get   - receive a file (to be answered to a SEND request).
tget - receive a text file.
list - list all DCC connections.
sendvideo nick - sends a video snapshot to a selected nick
sendvideostream nick - sends your video stream to a selected nick (type
/video or /av to open the video window)
sendface nick - sends your face(s) to a selected nick
sendaudiostream nick - sends audio to a selected nick (type /audio or /av to
open the audio window)

filename is only used by scripts.

```
/debug                          shows all low level messages in ircle. use at own
risk.
                                 unpredictable things may happen. for testing
only.
/exit message               = /bye
/fserve nick

starts a dcc chat/fserve with nick.  You will be the host
/ignore pattern             ignore messages from nick!user@host (may contain
wildcards)
        -pattern            removes a pattern from the ignore list (also check
your friends list
                             in your preferences)
/info                       gives info about server
/invite nick channel        invites nick to channel
/ison nick                  shows if a user is on irc. not implemented on some
servers.
/join                       joins channel last invited to
/join channel [passwd]      = /channel
/kick channel nick :msg     kicks nick from channel with message, clicking
Kick in the user
                             window does the same. Option click lets you set a
kick message.
/leave channel              leave a channel, same as closing a channel window
/links                      show server connections
/links  mask                 shows all servers matching mask
/list                       list channels. Note: on some servers you'll get
disconnected because
                             of the large amount of data /list generates. Use
wildcards in the
                             refresh window.  Example:  *mac*
      -min #                list only channels with minimum of # users
      -max #                list only channels with maximum of # users
      -public               list only public channels
      -private              list only private channels
      -local                list only local channels
      -global               list only global channels
      -topic                list only channels with topic set
      -mask-                list only channels matching 'mask', for
instance /list -*mac*
/lusers                     display statistics: the number of users on irc
worldwide and the
                             number of channels.
```

```
/map                      displays a map of all server connections (undernet
only)
/massop                   gives operator status to everyone on a channel
/massdeop                 removes operator status from everyone but you on a
channel
/massunban                removes all bans from a channel
/me action                sends an action description, can also be used on a
dcc chat window
                          (private action). shortcut: Option Return.
/mode channel parm        set channel mode:
        +p                private channel
        +s                secret channel
        +i                invite-only channel
        +m                moderated channel, noone can speak except users
with mode +v
        +n                no messages from outside channel
        +t                only channel operator may set topic
        +l #              channel may hold at most # users
        +v nick           let nick speak on moderated channel
        +b                ban list. Not implemented on some servers.
        +b nick!username@hostname  ban nick
        +k key            set channel password
        +o nick           nick becomes channel operator
        -x                removes flag x, where x is one of the above
                          You can also you the switches in the Userlist
window for this.
/mode nick parm           set user mode:
        +i                invisible user
        +s                receive server notices
        +w                receive wallops
        +o                IRC operator
        +d                deaf mode, for bots only.
/motd [server]            show message-of-the-day [of another irc server]
/msg nick message         sends nick a private message. Pressing TAB
automatically sets the
                           inputline to /MSG and the nickname that last sent
you a message.
                          Ircle remembers up 10 nicks until 15 minutes after
the last
                          activity.
/names channel            list users on channel
/nick newnick             change your nickname
/note                     unknown
/notice user|channel msg  (almost) like /msg
/notify                   show notify list
/notify nick              adds nick to notification list (show each
signon/off)
        -nick             removes nick from notification list
put the /notify command in the startup command to have it run whenever you
connect.
/omsg text                send a message to all channel operators on a
channel
/onotice text             send a notice to all channel operators on a
channel
/op nick                  gives nick operator status
/deop nick                removes operator status from nick
/part channel             = /leave
```

```
/ping                       pings a user. to measure the delay use /cping
/quote raw irccommand        sends a command to an irc server, exactly as
typed.
/query nick                 open window for private messages to nick
/quit message               = /bye
/server hostname [port]    switch to a different server
/silence                    show ignored users list
/silence mask               ignores users with selected mask
/signoff message            = /bye
/sound channel soundname

plays soundname to the channel
/sound nick soundname       plays soundname to nick
/stats                      show statistical info:
     b                      shows server ban list
     c                      returns a list of servers which the server may
connect to or allow
                            connections from
     h                      returns a list of servers which are either forced
to be treated as
                            leaves or allowed to act as hubs
     i                      returns a list of hosts which the server allows a
client to connect
                            from
     k                      returns a list of banned username and hostname
combinations for that
                            server
     l                      returns a list of the server connections, showing
how long each
                            connection has been established and the traffic
over that connection
                            in bytes and messages for each direction
     m                      returns a list of commands supported by the server
and the usage
                            count for each if the usage count is non zero
     o                      returns a list of hosts from which normal clients
may become
                            operators
     p                      ?

s                    ?
     t                      ?
     u                      returns a string showing how long the server has
been up
     y                      show Y (Class) lines from the server configuration
file

/summon user@host           invites user@host to IRC (host must be running a
server) obsolete??
/time                       = /date
/topic channel text         set a channel topic (double clicking in the title
bar of a channel
                             lets you achieve the same)
```

```
/trace [user]            shows which servers are being used to connect to
user
/type                    type a text file to the current channel
/unban                   opens the unban dialog, allowing to view and unban
hosts with a
                          simple click.
/unban nickmask          removes 'mask (nick!username@hostname) from the
channel ban list
/users                   (x)
/version                 show server version
/video
```

```
opens your video window
/who channel             list people on channel
/whois                   give information about nick that last joined the
channel or sent
                          private message
/whois nick              give information about nick
/whowas nick             give information about nick no longer online
/xdcc nick               show users XDCC commands
/xdcc nick LIST          show users list of files to download.
/xdcc nick SEND #        get users files number #
/xdcc nick VERSION       show users XDCC version.
```

```
Valid commands for /xdcc are

list  - list files
help  - show help
send  - ask for a file

IRC Operator commands:

/connect target port     Force the remote server to try establishing a new
server connection to the target server, on the specified port.
/die                     Used by IRC operators to force the server to exit
and cease activity.
/hash                    reconfigure a server
```

```
/host
/kill nick comment          The KILL message is used to cause a client-server
connection to be closed by the server which has the actual connection. KILL
is used by servers when they encounter a duplicate entry in the list of valid
nicknames and is used to remove both entries. It is also available to
operators.
/oper nick password         Used by a normal user to gain operator privileges.
/rehash                     Used by IRC operators to force the server to re-
read its configuration file.
/restart                    Used by IRC operators to force the server to
restart.
/squit server comment       Close a server connection.
/uping                      Measures ping times between irc servers
/wallops message            message to all operators (deprecated)
```
