Introduction

What is MacAMP Lite?

MacAMP Lite is a MacOS™ application designed to provide an easy-to-use and lightweight interface to play various popular sound formats, such as MPEG Layer II and III, CD Audio, .MOD , .S3M and more.

MacAMP Lite uses special modules called "engines". Every module provides playback routines for specific sound formats. Engines used by MacAMP are compatible with MacAMP Lite, therefore all sound formats supported by MacAMP application can be supported by MacAMP Lite, allowing great flexibility in use.

MacAMP Lite also supports a technology called "Phrase Books". By downloading and installing only one file your copy of MacAMP Lite will 'speak' your localized language - without modifying the application itself. The latest Phrase Books for MacAMP Lite are available at the Phrase Books web page, <http://www.macamp.com/lite/>.

Installing MacAMP Lite

To install MacAMP Lite, simply unstuff the application and "Plugins" folder into the desired location. That's it – nothing can be simplier!

System Requirements

MacAMP Lite requires a PowerPC processor, MacOS™ 7.5 or later, and at least 512K of free RAM. PowerPC 603 or better processor is recommended for MPEG Audio playback.

Supported Sound Formats

MacAMP Lite with the default engines supports sound formats listed below. Please note that the list of sound formats can be easily expanded by adding other engines to the Plugins folder.

- .669
- .AMF
- CD Audio
