

Overview

Recording vinyl LPs to CDs or MP3 Files

To record a vinyl LP to convert to a CD or group of MP3 Files you need to use a 'WAV file recorder' to store the recording as a WAV format file on your hard disk. Most general purpose WAV recorders are packed with functions. As a result, they tend to be complicated and time-consuming to configure and use.

In contrast, LP Recorder has been designed with one purpose in mind - to record vinyl LPs. Connect the tape or line output from your stereo to the line input of your soundcard, enter a filename, select the recording source and press the record button.

Special features of LP Recorder suited to recording vinyl are:

- Automatically adjusts optimum recording levels to avoid distortion
- Auto start and auto stop for easy operation
- Visual level meter can be used to check recording levels before AND during recording
- Level meter is displayed even if the soundcard does not support meters
- Large volume slider with numeric values for precise settings
- Skipping and clipping protection and detection
- Pause recording - useful for recording a selection of tracks from different LPs
- The remaining recording time, based on the free space on your disk, is displayed
- The recorded file is ready for further processing as soon as the recording has finished
- Produces an LP Ripper-compatible Tracks (TRK) File
- Minimum number of settings for easy configuration

Getting Started

Before you start, you will need:

- **Free hard disk space**

You will need approximately 300Mbytes of free hard disk space to record 30 minutes of music equivalent to CD quality.

- **A turntable / amplifier connected to the sound card installed in your computer.**

Connect the *tape output* or *line output* of your stereo amplifier to the *line input* of your sound card. If you do not have a suitable cable, you can purchase one from Tandy / Radio Shack or a similar electronic store.

NOTE: Do not use the microphone input of your soundcard. It is too sensitive and will result in loud distorted sound.

NOTE: You cannot connect your turntable directly to the soundcard as the signal is not strong enough. If you are not able to connect your turntable via your main stereo amplifier, you could purchase a 'Phono Preamp' to match the signal levels required. These vary in cost from as low as \$US20 to a few hundred dollars for the connoisseur 'Hi-Fi' version.

For each LP that you want to record as a WAV file:

- **Start LP Recorder.**

The status bar displays 'Preview'.

- **Specify a Directory**

Enter the name of the Windows directory where you want to save the WAV file. The recording time available, based on the amount of free disk space on that drive, is displayed.

- **Specify a Filename**

Enter the name of the WAV file that you are going to create. To ensure compatibility with other sound processing and CD writing programs you should give the filename a .wav extension e.g. *myfile.wav*

- **Select the Recording Input**

Select 'Line-in' (just called 'Line' with some soundcards) from the combo box above the time display.

- **Set the Recording Level**

Uncheck the Mute checkbox
Check the Auto Start/Stop checkbox
Check the Auto Level checkbox

Play one of the loudest parts of the LP and adjust LP Recorder's volume level so that the level meter does not reach the highest level. If the level meter doesn't display any activity, make sure that line-in is selected by [setting the Windows Recording Control](#)

- **Press the Record Button**

The status bar displays 'Waiting' and the record button changes colour to yellow.

- **Play the LP.**

As soon as the stylus touches the LP, the recording should start. The status bar displays 'Recording', the record button changes colour to green and the recording time so far is shown.

- **Stop playing the LP.**

When the LP has finished playing, lift the stylus and the recording should automatically stop. The record button changes colour to red.

- **Check the recording**

Click on the Player tab and press the Play button. The WAV file you have recorded is played.

- **Separating Tracks**

Before you save the recording to CD or convert it to MP3 files, you will need to split the WAV file into a separate WAV file for each track. The companion program from CFB Software, [LP Ripper](#), was designed especially for this task. Check the [CFB Software Website](#) for details.

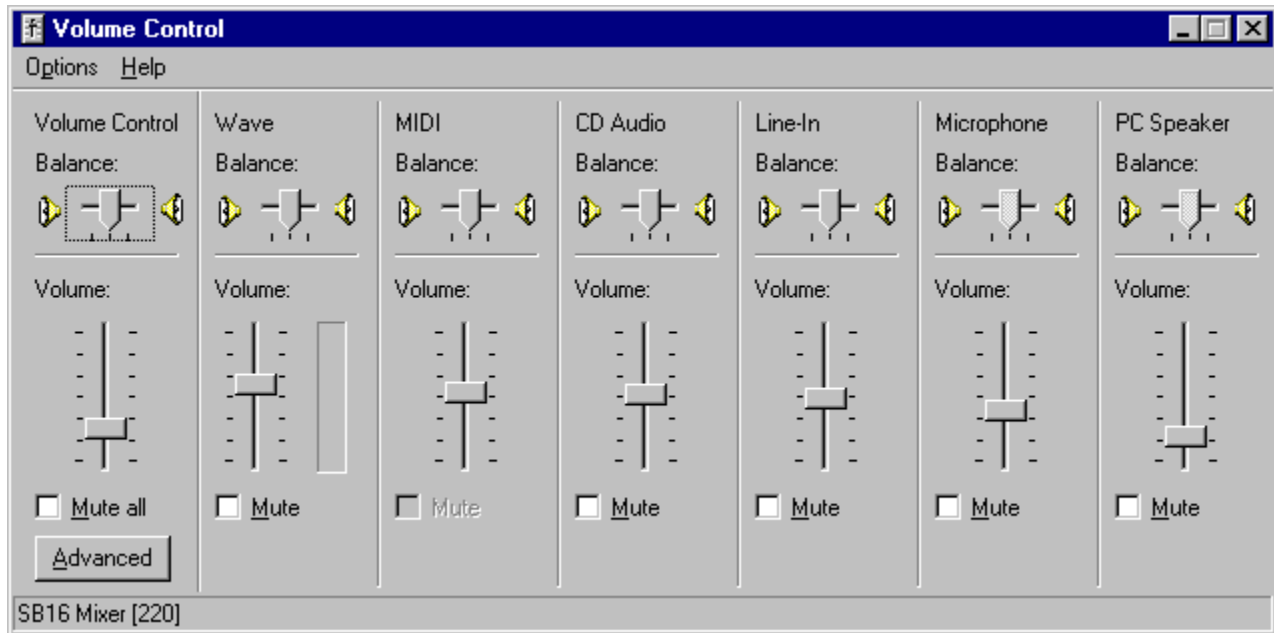

Alternatively, but less convenient, you could use LP Recorder to just record one track at a time.

Setting the Windows Recording Control

The Windows Audio Mixer / Volume Control / Recording Control program controls the combination of audio inputs and outputs to your soundcard. This includes the inputs that are used for recording.

If you can hear your LP playing through the computer speakers but the level meter displays nothing and the recorded file just contains silence, check that your recording input e.g. Line-In, is selected in Windows. To do this:

1. Start the Windows Volume Control by double-clicking on the speaker icon  in the Windows System Tray - normally at the bottom right hand corner of your screen.

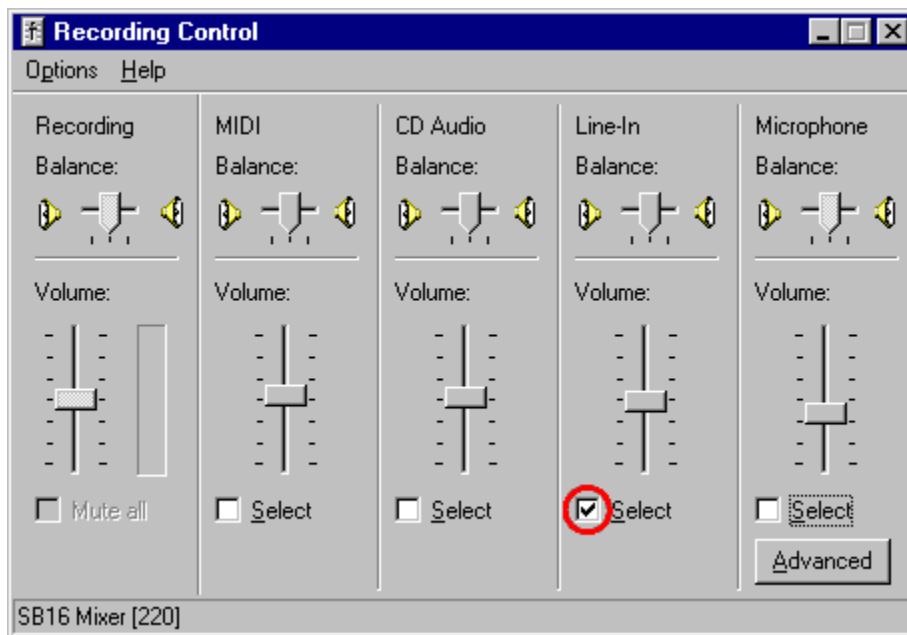

2. Select Properties from the Options menu.
3. Select Recording from the group box and check all of the volume controls shown.

4. Click on OK.

5. Check the select box on the Line-in volume control. (This is VERY important!)

6. Select Exit from the Options menu to close the Windows Recording Control. The settings are saved until they are changed again.

CFB Software Web Site

The CFB Software Web Site can be found on the Internet at:

<http://www.cfbsoftware.com.au>

Visit the site to:

- Get the most up-to-date information on LP Ripper and LP Recorder
- Download the latest versions
- Find links to Noise-reduction software and MP3 Encoders
- Order LP Recorder on-line using a credit card

Recorder Controls

When you start LP Recorder, the recorder tab is selected and the recorder controls are displayed.

'Preview' is displayed in the status bar.

Selecting the Recording Input

The combo box above the time display has a list of the recording sources of your soundcard e.g. Microphone, CD Audio, Line-in, MIDI etc. Select the source corresponding to the input on your soundcard that you have connected to the line-out or tape-out output of your stereo amplifier. Normally, when recording LPs, this would be the 'Line-in' input (simply called 'Line' on some soundcards).

Setting the Recording Level

To set the optimum recording level, play the loudest parts of the LP you are going to record and adjust the Volume slider control while observing the level meter. The meter should display just less than the maximum level when the loudest section of the LP is playing. If you check the Auto Level checkbox, the volume control automatically lowers itself if the level is too high.

Specifying the WAV Filename

Enter the name of the directory where you want to store the recorded WAV file in the directory box. Enter the name that you want to give to the WAV file in the filename box. To ensure compatibility with other sound processing and CD writing programs you should give the filename a .wav extension e.g. *myfile.wav*

Start Recording

Click the record button when you are ready to start the recording.

If you have checked the Auto Start / Stop checkbox, the Status bar displays 'Waiting' and the record button changes colour to yellow. The recording does not actually start until you have lowered the stylus onto the LP.

Once the recording has started, the Status bar displays 'Recording', the record button changes colour to green and the recording time so far is shown in minutes and seconds.

Pause Recording

To temporarily stop the recording, click the pause button. The record button changes colour to yellow. Click the pause button again to restart the recording. This is useful if you are recording a selection of tracks from different LPs.

NOTE: Once the recording has started, clicking the record button also pauses and restarts the recording.

Stop Recording

When the LP has finished playing, click the stop button.

If you have pressed the Auto Start / Stop checkbox, the recording automatically stops when you lift the stylus. 'Preview' is displayed in the Status bar.

Recording Quality

The recorded WAV file is a 44.1Khz 16-bit Stereo file suitable for writing to a recordable audio format CD using the software supplied with your CD Writer.

Auto Start / Stop

When the Auto Start / Stop checkbox is checked, LP recorder automatically starts the recording when the stylus is lowered onto the LP and stops the recording when the stylus is raised from the LP. Situations where this is useful include:

- a. The turntable is located some distance from the computer and you are operating the turntable manually. Without Auto Start / Stop, by the time you get back to the computer to start the recording the music would have already started.
- b. If your turntable automatically lifts the stylus at the end of the LP you can leave the recording unattended. Without Auto Start / Stop you would risk recording a long period of silence if you didn't return soon after the music stopped.

You will need to set the Start / Stop Level to suit your system using the *Preferences* selection from the Options menu before using this feature.

When LP Recorder Auto Start / Stop is checked, click on the record button BEFORE you lower the stylus onto the groove. The recording will start when the stylus touches the surface and will automatically stop when the stylus is lifted from the surface. i.e. it is detecting the difference between just surface noise and no stylus motion at all.

Auto Start / Stop should work similarly when recording from tapes or cassettes, as long as there is a significant difference in noise level between when the tape is stopped and when it is in motion i.e. no signal vs. tape hiss.

Player Controls

When you click on the Player tab, the controls to play a WAV file are displayed.

Specifying the WAV Filename

Enter the name of the directory where the recorded WAV file is stored, in the directory box. Enter the name of the WAV file in the filename box. To ensure compatibility with other sound-processing and CD-writing programs you should give the filename a .wav extension e.g. *myfile.wav*

Start Playing

Click the play button to start playing the recorded WAV file. The time display shows how many minutes and seconds the recording has been playing and how long it is until it finishes.

Pause Playing

Click the pause button to temporarily stop playing the recorded WAV file. Click on the pause button again to restart playing the file.

Stop Playing

Click the stop button to stop playing the recorded WAV file.

Skipping and Clipping

Two common problems that can occur with recording software are 'skipping' and 'clipping'. LP Recorder attempts to detect and prevent these problems.

Skipping

If other resource-intensive programs are running on the computer during recording 'skipping' can occur. The effect is similar to that heard on a portable CD player when it is jarred - a short gap or jump is heard in the music. This occurs when LP Recorder has not been able to store the music recorded so far, before it receives more samples from the sound card.

The solution is similar to that used in the anti-skip devices in the portable CD players. LP Recorder temporarily saves the recording in RAM so that an interruption can last for as long as ten seconds before any of the recording is lost.

Generally, interruptions only last for at most 1 or 2 seconds and skipping does not occur. If, however, an ill-behaved program does cause skipping, the number of skips is displayed on the status bar. It is also logged with the corresponding track time in the trace file.

NOTE: If skips were not detected during recording but can be heard during playback, it is most likely that it is the playback software that is being interrupted. This can be easily checked because the skips would be heard in different places each time the recording is played. The solution is to try a different player or to avoid running the program that is the cause of interruptions during playback.

Clipping

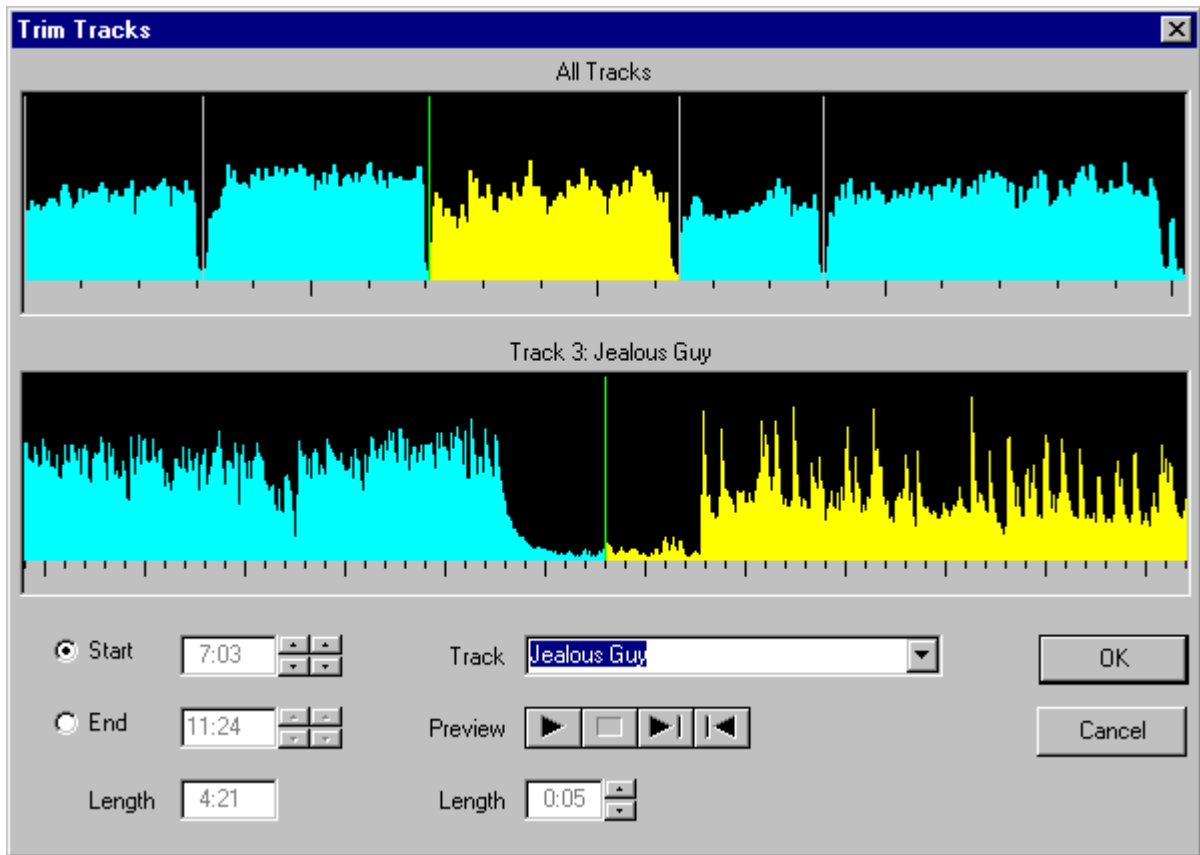

If the input signal is too high for your soundcard 'clipping' can occur and the signal is truncated. If the overload is severe, the result is an unpleasant distorted crackling sound. Clipping can be avoided by using the Auto Level feature to set the volume control to a suitable level.

Because a sample that has the maximum value cannot be distinguished from one that has been truncated it is impossible for LP Recorder to differentiate between the two. As a best guess, LP Recorder designates a clip as being three successive samples with the maximum value on the same stereo channel. The count of clips is displayed on the status bar. It is also logged with the corresponding track time in the trace file. If the count of clips is only one or two, you can usually ignore them as distortion is unlikely to be noticeable.

The maximum level (peak) since the volume was last adjusted is also displayed on the status bar.

NOTE: You can reset the peak level, skip and clip counters, at any time, by clicking on the status bar.

LP Ripper

If you are creating MP3 files or music CDs from your vinyl LPs you will need to save each track as a separate WAV file.

LP Ripper is a companion program from CFB Software which makes this task much easier. Just record each side of your LP as a single WAV file with LP Recorder. LP Ripper automatically splits the file into a separate WAV file for each track, and optionally calls your MP3 Encoder to produce an MP3 file for each track.

Download the trial version from the CFB Software website at:

<http://www.cfbsoftware.com.au>

Additional Features

- Listen to any track before you process it using the preview.
- Use the visual editing feature to trim the start and end of each track to a precision of 0.1 seconds.
- Replace the hiss between tracks with silence.
- The MP3 encoded LP takes up about 30-40 Mbytes. Typically you can store the equivalent of 2-3 LPs on a 100Mb Zip disk or more than a dozen LPs on a single CD.
- Track names can be edited using the full 255 characters of Windows' long file names even if your MP3 Encoder does not support them.

- LP Ripper can use the Tracks (TRK) File that LP Recorder can generate - it then doesn't have to spend time reading the WAV file before it analyses it.

How does LP Ripper work?

LP Ripper calculates the length of each track by detecting the gap between tracks and displays a track listing showing the time of each track. You can then select which track(s) you want to save as separate WAV or MP3 files.

Some LPs have little or no gaps between tracks; others have long quiet sections that could be mistaken for a gap. LP Ripper lets you change the times that it has calculated and automatically adjusts the length of the remaining tracks.

Tracks (TRK) File

If you have checked the Use Tracks File checkbox, when you exit LP Recorder or go to record a different WAV file, LP Recorder will create a 'tracks' file with the same name as the current WAV file, with a TRK extension. E.g. if the WAV file is called *myfile.wav* the tracks file will be called *myfile.trk*.

The tracks file saves a summary of the WAV file that can be used by LP Ripper. This saves time because LP Ripper does not have to spend time reading the WAV file again before it analyses it.

NOTE: Both the WAV file and the TRK file are located in the same directory.

Troubleshooting

The meter display is not working

The recorded file just contains silence

If you can hear your LP playing through the computer speakers but the level meter displays nothing and the recorded file just contains silence, check that your recording input is enabled in Windows by [setting the Windows Recording Control](#)

LP Recorder has terminated.

WAV device not supported

If you get this error message when you start LP Recorder your preferred Recording device is not set to a suitable WAV device.

1. Using Windows Control Panel, select MultiMedia
2. Click on the Audio tab.
3. Make sure that the recording device is set to the Wave Input device of your soundcard. An example showing three input devices is:

SB16 Wave in [220]
Game Compatible Device
Voice Modem Wave #00 Line

SB16 Wave In would need to be selected for it to work - check the documentation that came with your soundcard if you need any more information.

The recording stops after a few seconds.

Uncheck the Auto Start / Stop checkbox to disable the Auto Stop feature. See [Auto Start / Stop](#) for information on how to use this feature.

The CD Writer does not recognise the WAV file

Make sure you give the WAV file a name with a .wav extension e.g. *myfile.wav*

Trace File

Whenever LP Recorder is terminated it saves a 'trace' file called LPRTTrace.txt in your Windows temporary files directory (e.g. C:\WINDOWS\TEMP)

If you encounter a problem that you are unable to solve, email a copy of this trace file to technical support at:

info@cfbsoftware.com.au

with a description of what you were trying to do when the error occurred.

New - File Menu

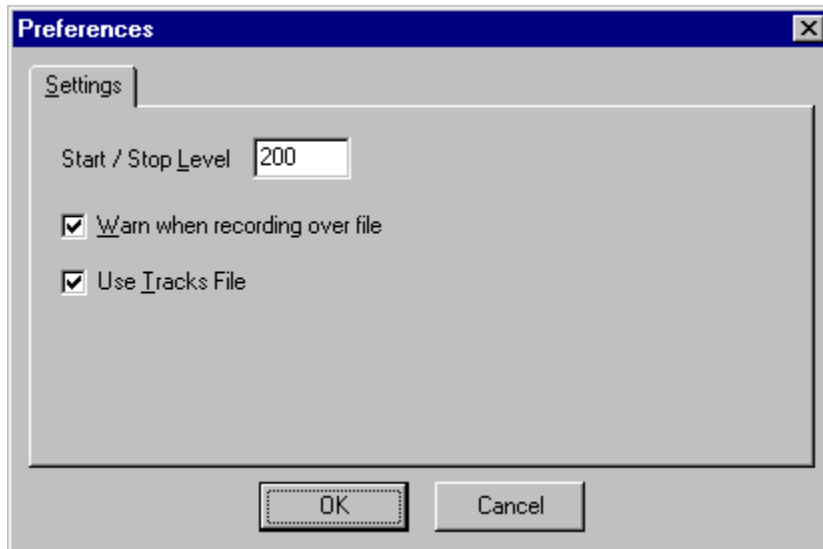

Select the *New* menu command to specify the location and name of the WAV file that you are recording. The Filename and Directory display boxes are updated and the available recording time, based on the amount of free disk space on the drive, is displayed.

Exit - File Menu

Select *Exit* to terminate LP Recorder and return to Windows.

Preferences - Options Menu

Set the preferences to suit your system.

Warn when recording over file

Check this setting if you don't want to accidentally record over an existing file. When you press the record button, LP Recorder warns you that the file exists and ask you if you want to delete it. If you click on No the recording is cancelled.

Start / Stop Level

This value is used with Auto Start / Stop. It represents the difference in level between the silence when the stylus is not in contact with the LP and the silence at the beginning of the LP. The default value is 200. To determine a suitable value for your system:

1. Connect your stereo to your soundcard and start LP Recorder
2. Set the LP Recorder volume level to mid-range
3. Observe the level value displayed in the status bar
4. Lower the stylus onto the beginning of an LP
5. Observe the level value displayed in the status bar

A suitable value is halfway between the values in (3) and (5)

e.g. if the level is 196 when the stylus is raised, and 804 when it is lowered, a suitable level is:

$(804 - 196) / 2$ which is approximately 300. This value is close enough to use.

Use Tracks File

If this box is checked, when you exit LP Recorder or start recording a different WAV file, LP Recorder will create a Tracks File.

How to Order LP Recorder

LP Recorder V4.0 © Copyright 2000-2001. CFB Software. All Rights Reserved.

LP Recorder is a 32-bit program designed for use with Windows 95, 98, ME and NT4. It should also work on Windows 2000 but is untested at the current time.

Trial Version

The trial version of LP Recorder is free. It has all of the features of the full program except that recordings terminate after 5 minutes. You are free to distribute the trial version. It may be given away to friends, included on CD-ROM libraries, uploaded to Internet Web sites, ftp sites and bulletin boards, etc. as long as it is distributed in its complete original form.

How to Order

You can order the full version of LP Recorder on-line in \$US or Euro currency using:

- Credit card
 - Visa
 - MasterCard
 - American Express
 - Diners Club
 - Eurocard
- Wire transfer
- EuroCheque
- Cash.

Go to the CFB Software Web page at:

www.cfbsoftware.com.au

Select the LP Recorder page from the index and select *Order* from the menu. Follow the instructions there.

Once your order has been forwarded to CFB Software, your Registration Details will be e-mailed to you. This will normally be within 24 hours.

If you want to order by mail using cash or a cheque in US, Australian or UK currency, send an e-mail to:

info@cfbsoftware.com.au

for the latest information.

Technical Support

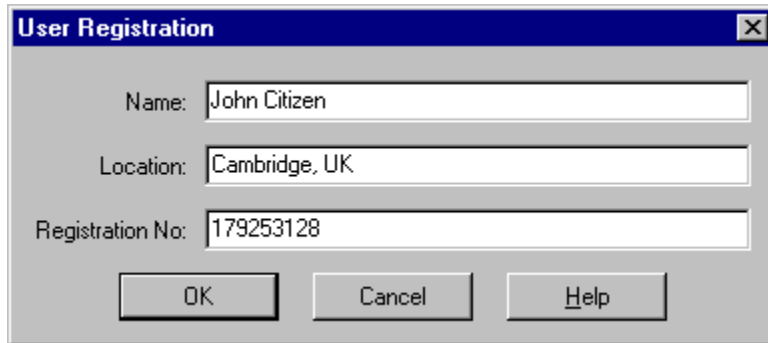

If you need technical support send an e-mail saying which version of LP Recorder you are using and include a description of the problem and the steps required to reproduce it to:

info@cfbsoftware.com.au

If the problem is related to producing the WAV file, include a copy of the corresponding Tracks File. **DO NOT** send the WAV file as these are normally too large to handle.

Entering the Registration Details

When you have received your Registration details, start LP Recorder, select *Register* from the *Help* menu and enter the details.

A screenshot of a Windows-style dialog box titled "User Registration". The dialog has a blue title bar with a close button (X) in the top right corner. Inside the dialog, there are three text input fields. The first field is labeled "Name:" and contains the text "John Citizen". The second field is labeled "Location:" and contains the text "Cambridge, UK". The third field is labeled "Registration No:" and contains the text "179253128". At the bottom of the dialog, there are three buttons: "OK", "Cancel", and "Help".

User Registration [X]

Name: John Citizen

Location: Cambridge, UK

Registration No: 179253128

OK Cancel Help

As soon as you have entered the correct details, the 5 minute restriction on the length of the recording is removed. The length of the recording is only limited by the amount of free disk space or any Windows limit on file size.
