

# CursorPos

An Extension for QuarkXPress<sup>fi</sup>

The CursorPos extension to QuarkXPress provides a floating palette to continuously display the position of the text cursor.

The figure at the right shows the CursorPos floating palette. When the cursor is located in a text box the CursorPos palette will display the horizontal and vertical position of the cursor in the current horizontal and vertical units of your document. The position is updated continually as you move the cursor through the text.

The X popup menu in the palette allows you to choose that the cursor horizontal displacement be measured from the the text inset of the left edge of the current text box, from the left margin of the page or from the left edge of the page.

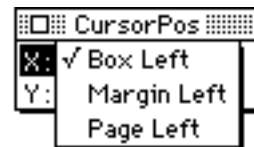

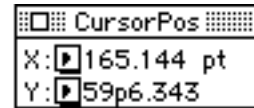

The Y popup menu in the palette allows you to choose that the position of the baseline of the cursor line be measured from the top of the current text box, from the top margin of the page or from the top of the page.

This allows for easy comparison between locations in different boxes which are located at different positions on a page or spread.

System Requirements: QuarkXPress 3.1

Demonstration Limitations:

The CursorPos Demo allows you to display the CursorPos palette once. While the palette

## KyTek, Inc.

28 Duck Pond Road, Weare, NH 03281 USA

is active it will update the cursor position 100 times.
