

Note to users of Virtual Memory and Quadras

This version of INIT-Scope will not provide an accurate report if virtual memory is on. If you want to use INIT-Scope 2.1 to get a full report of the startup activities of your Macintosh, then temporarily turn off virtual memory and restart. Then turn off INIT-Scope (from the control panel) so that future restarts will not erase the startup file.

If you are using INIT-Scope on a Quadra, you must first turn off the cache. This will be fixed in a future version of INIT-Scope.
