

Morph™ is a breakthrough application which allows you to smoothly transform two or more images into each other, creating QuickTime™ movies, PICS animations, and still images. This popular special effect has been used in recent feature films, music videos and television commercials. Now this exciting technology is available on the Macintosh, producing dazzling images and animations.

Flo' turns your 2D images into a pliable, plastic-like surface which you can stretch, distort, and pull without causing any degradation to the original image quality! With Flo' you can scale, translate, rotate, skew or perform arbitrary transformations on any part of an image while the rest of the image remains unchanged. You have global or local control without the use of control points or grids.
