

JAG is the complete anti-aliasing software utility for the Macintosh. JAG removes the jagged edges from PICT and PICS files automatically. JAG delivers pixel-perfect 8- and 24- bit still images and animations. JAG is compatible with almost any graphic software. With many 3d programs it slashes your production time by removing the 'jaggies' after the rendering. It has an edge-tracking mechanism, adaptive palettes and custom dithering, handles high-res images up to 4k, and protects small text and single points.
