5i’

4.5.17 *Keypad facility*

The purpose of the Keypad facility information element is to convey IA5 characters, e.g., entered by means of a terminal keypad.

The Keypad facility information element is coded as shown in Figure 4-25/Q.931. The default maximum length of this information element is 34 octets.

Figure 4-25/Q.931 [T108.931], p.

4.5.18 *Low layer compatibility*

The purpose of the Low layer compatibility information element is to provide a means which should be used for compatibility checking by an addressed entity (e.g., a remote user or an interworking unit or a high layer function network node addressed by the calling user). The Low layer compatibility information element is transferred transparently by an ISDN between the call originating entity (e.g., the calling user) and the addressed entity. See Annex B and Annex L.

If low layer compatibility negotiation is allowed by the network (see Annex M), the Low layer compatibility information element is also passed transparently from the addressed entity to the originating entity.

The Low layer compatibility information element is coded as shown in Figure 4-26/Q.931 and in Table 4-18/Q.931. The maximum length of this information element is 16 octets.

4.5.19 *More data*

The More data information element is sent by the user to the network in a USER INFORMATION message, and delivered by the network to the destination user(s) in the corresponding USER INFORMATION message. The presence of the More data information element indicates to the destination user that another USER INFORMATION message will follow containing information belonging to the same block.

The use of the More data information element is not supervised by the network.

The More data information element is coded as shown in Figure 4-27/Q.931.

Figure 4-26/Q.931 [1T109.931] (traiter comme tableau), p. 2

1	First segment of segmented message
}	
{ *Number of segments remaining (octet 3)*	
Binary number indicating the number of remaining segments within the message to be sent.	
}	
{ *Segmented message type (octet 4)*	
Type of message being segmented coded as per § 4.4.	
Note — Bit 8 is reserved for possible future use as an extension bit.	
}	

Tableau 4-24/Q.931 [T130.931], p. 24

4.5.26 *Sending complete*

The purpose of the Sending complete information element is to optionally indicate completion of called party number, see §§ 5.1.3, 5.2.1 and 5.2.4.

It is a single octet information element coded as shown in Figure 4-34/Q.931.

Figure 4-34/Q.931 [T131.931] (à traiter comme tableau), p. 25

4.5.27 *Signal*

The purpose of the Signal information element is to allow the network to optionally convey information to a user regarding tones and alerting signals. (See §§ 7 and 8.)

The Signal information element is coded as shown in Figure 4-35/Q.931 and Table 4-25/Q.931. The length of this information element is 3 octets.

The Signal information element may be repeated in a message.

4.5.28 *Transit network selection*

The purpose of the Transit network selection information element is to identify one requested transit network. The Transit network selection information element may be repeated in a message to select a sequence of transit networks through which a call must pass. See Annex C.

The Transit network selection information element is coded as shown in Figure 4-36/Q.931 and Table 4-26/Q.931. The default maximum length of this information element is network dependent.

Figure 4-36/Q.931 [T134.931] (a traiter comme tableau), p. 28

}

Tableau 4-26/Q.931 [T135.931], p. 29

4.5.29 *User-user*

The purpose of the User-user information element is to convey information between ISDN users. This information is not interpreted by the network, but rather is carried transparently and delivered to the remote user(s).

The User-user information element is coded as shown in Figure 4-37/Q.931 and Table 4-27/Q.931. There are no restrictions on the content of the user information field.

In SETUP, ALERTING, CONNECT, DISCONNECT, RELEASE and RELEASE COMPLETE messages, the User-user information element has a network dependent maximum size of 35 or 131 octets. The evolution to a single maximum value is the long term objective; the exact maximum value is the subject of further study.

In USER INFORMATION messages sent in association with a circuit-mode connection, the User-user information element has a network dependent maximum size of 35 or 131 octets. For USER INFORMATION messages sent in a temporary or permanent user-user signalling connection, the user information field contained inside this information element has a maximum size equal to the maximum size of messages defined in § 3, that is 260 octets.

Note — The User-user information element is transported transparently by an ISDN between a call originating entity, e.g., a calling user and the addressed entity, e.g., a remote user or a high layer function network node addressed by the call originating entity.

4.6 *Supplementary services information elements*

4.6.1 *Date/time*

The purpose of the Date/time information element is to provide the date and time to the user. It indicates the point in time when the message has been generated by the network.

Note — It is a network dependent matter whether the time indicated is local time or Coordinated Universal Time (UTC) and which calender is used for referencing the date.

The Date/time information element is coded as shown in Figure 4-38/Q.931. Octets 3-8 are binary coded (bit 1 being the least significant bit).

Figure 4-38/Q.931 [T138.931] (a traiter comme tableau), p. 32

Blanc

4.6.2 *Facility*

The purpose of the Facility information element is to indicate the invocation and operation of supplementary services, identified by the corresponding operation value within the Facility information element. The Facility information element is defined in Figures 4-39/Q.931 to 4-43/Q.931 and Tables 4-28/Q.931 to 4-33/Q.931.

Note — The generic structure and codepoints for the Facility information element are defined in Recommendation Q.932. This section contains only the coding required for procedures described in § 7 of this Recommendation.

The Facility information element may be repeated in a given message.

The maximum length of the Facility information element is application dependent consistent with the maximum length of the message.

Cumulative transit delay value [octet 3 (bits 1-2) octets 3a and 3b]

Cumulative transit delay value binary enco ded in milleseconds. Bit 2 of octet 3 is the highest order bit and bit 1 of octet 3b is the lowest order bit. The cumulative transit delay value occupies 16 bits total.

}

{

Requested end-to-end transit delay value [octet 4 (bits 1-2) octets 4a and 4b]

Requested en-to-end transit delay value binary enco ded in milleseconds. Bit 2 of octet 4 is the highest order bit and bit 1 of octet 4b is the lowest order bit. The requested end-to-end transit delay value occupies 16 bits total.

}

{

Maximum end-to-end transit delay value [octet 5 (bits 1-2) octets 5a and 5b]

Maximum end-to-end transit delay value binary enco ded in milleseconds. Bit 2 of octet 5 is the highest order bit and bit 1 of octet 5b is the lowest order bit. The maximum end-to-end transit delay value occupies 16 bits total.

Note — For a Recommendation X.31 typ e of access to an ISDN the procedures only apply in the notification phase at the terminating exchange. At the terminating exchange, if the End-to-End Transit Delay facility is present in the X.25[5] incoming call request packet, the contents should be copied into End-to-end transit delay information element as fol-lows:

i) The cumulative transit delay field (octets 3 and 4) of the X.25 end-to-end transit delay facility should be copied into octets 3, 3a and 3b. The bit order should be preserved as described above in the description.

ii) If octets 5 and 6 are present in the X.25 end-to-end transit delay facility, they should be inter-preted as the requested end-to-end transit delay value. The value present should be copied into octets 4, 4a and 4b.

The bit order should be preserved as described above in the description.

iii) If octets 7 and 8 are present in the X.25 end-to-end transit delay facility, the value present is the minimum end-to-end transit delay allowed. Octets 7 and 8 should be copied into octets 5, 5a and 5b. The bit order should be preserved as described above in the description.

}

4.7.3 *Packet layer binary parameters*

The purpose of the Packet layer binary parameters information element is to indicate requested layer 3 parameter values to be used for the call.

The Packet layer binary parameters information element is coded as shown in Figure 4-47/Q.931 and Table 4-38/Q.931.

The maximum length of this information element is 3 octets.

Figure 4-47/Q.931 [T159.931] (a traiter comme tableau), p. 53

4.7.4 *Packet layer window size*

The purpose of the Packet layer window size information element is to indicate requested layer 3 window size value to be used for the call. The values are binary-encoded.

The Packet layer window size is coded as shown in Figure 4-48/Q.931.

The maximum length of this information element is 4 octets.

Figure 4-48/Q.931 [T161.931] (a traiter comme tableau), p. 55

Blanc

4.7.5 *Packet size*

The purpose of the Packet size information element is to indicate the requested packet size values to be used for the call. The values are encoded $\log_2$.

The Packet size information element is coded as shown in Figure 4-49/Q.931.

The maximum length of this information element is 4 octets.

Figure 4-49/Q.931 [T162.931] (à traiter comme tableau), p. 56

Blanc

4.7.6 *Redirecting number*

The purpose of the Redirecting number information element is to identify the number from which a call diversion or transfer was invoked.

The Redirecting number information element is coded as shown in Figure 4-50/Q.931 and Table 4-39/Q.931.

The maximum length of this information element is network dependent.

Figure 4-50/Q.931 [T163.931] (à traiter comme tableau), p. 57

Redirecting number information element

{
Type of number (octet 3) (Note 1)

Bits
7 6 5

0 0 0 unknown
(Note 2)
0 0 1 international
number (Note 3)
0 1 0 national
number (Note 3)
0 1 1 network
specific number (Note 4)
1 0 0 subscriber
number (Note 3)
1 1 0 abbreviated
number
1 1 1 reserved for
extension

All other values are reserved.
}
{ *Note 1* — For the definition of international, national and subscriber number, see Recommendation I.330 [18].

Note 2 — The type of number ‘‘unknown’’ is used when the user or the network has no knowledge of the type of number, e.g., international number, national number, etc. In this case the number digits field is organized according to the network dialling plan; e.g., prefix or escape digits might be present.

Note 3 — Prefix or escape digits shall not be included.

Note 4 — The type of number ‘‘network specific number’’ is used to indicate administration/service number specific to the serving network, e.g., used to acces an operator.
}
{ *Numbering plan identification (octet 3)*
}
{ *Numbering plan (applies for type of number = 000, 001, 010 and 100)*

Bits
4 3 2 1

0 0 0 0 unknown
(Note)
0 0 0 1
ISDN/telephony numbering plan (Recommendation E.164 [19]/E.163
[20])
0 0 1 1 data number-
ing plan (Recommendation X.121) [21]
0 1 0 0 telex number-
ing plan (Recommendation F.69) [22]
1 0 0 0 national stan-
dard numbering plan
1 0 0 1 private
numbering plan
1 1 1 1 reserved for

extansion

All other values are reserved.
}
{
Note — The numbering plan ‘‘unknown’’ is used when the user or the network has no knowledge of the numbering plan. In this case the number digits field is organized according to the network dialling plan; e.g., prefix or escape digits might be present.
}
{ *Presentation indicator (octet 3a)*

Bits
7 6

0 0 Presentation allowed
0 1 Presentation restricted

All other values are reserved.
}
{
Note — At the redirecting user-network interface, the presentation indicator is used for indicating the intention of the redirecting user for the presentation of the redirecting number to the called used. This may also be requested on a subscription basis. If octet 3a is omitted, and the network does not support subscription information for the redirecting number information restrictions, the value ‘‘00 — presentation allowed’’ is assumed.
}

4.7.7 *Transit delay selection and indication*

The purpose of the Transit delay selection and indication information element is to request and indicate the nominal maximum permissible transit delay applicable on a per call basis to that virtual call.

The Transit delay selection and indication information element is coded as shown in Figure 4-51/Q.931 and Table 4-40/Q.931.

The maximum length of this information element is 5 octets.

Figure 4-51/Q.931 [T166.931] (à traiter comme tableau), p. 60

H.T. [T167.931]

TABLE 4-40/Q.931

Transit delay selection and indication information element

{ *Transit delay selection and indication value [octet 3 (bits 1-2), octets 3a and 3b]* Transit delay value binary encoded in milliseconds. Bit 2 of octet 3 is the highest order bit and bit 1 of octet 3b is the lowest order bit. The transit delay value occupies 16 bits total. *Note* — For a Recommendation X.31[14] type of access to an ISDN the procedures only apply in the notification phase at the terminating exchange. At the terminating exchange, if the Transit Delay Selection and Indication facility is present in the X.25 [5] incoming call request packet, the two octet value should be copied into octets 3, 3a and 3b with the highest order bit contained in bit 2 of octet 3 and the lowest order bit contained in bit 1 of octet 3b. }

Tableau 4-40/Q.931 [T167.931], p. 61
