

## Setting Up TrashScan

Setting up TrashScan is easy! Just double-click on its icon to launch the program. The first time you launch TrashScan, a new set of preferences will be created.

TrashScan can listen on up to 10 custom channels, plus the 3 dedicated HTTP, FTP, and TELNET server channels. When TrashScan is launched the first time, each of the 10 custom channels is automatically assigned to a random port. This makes it impossible for anyone to guess which ports

TrashScan might be listening on.

That's it! If you don't want to make any special configurations, you never have to do anything except launch TrashScan.

Note: TrashScan only provides protection when it is running. Whenever you are connected to the network and TrashScan is not running, it will be impossible to detect a portscan.
