

onfiguring TrashScan

Remember, you don't have to make any changes to the settings for TrashScan to work normally. However, if you do want to make special settings, here's what to do.

Start by clicking the "Settings" button on TrashScan's main screen.

his will bring up the settings control panel, as shown below.

ach of the ten customizable channels is listed, along with the port each is assigned to, and whether or not it is actively listening. To change the port assigned to a particular channel, just place your mouse cursor over the port number, change the number as you desire, then press Return. To switch a channel on and off, just toggle the checkboxes in the "Enabled" column.

If you want to be able to use the integrated SMTP (email) capabilities of TrashScan, you must enter your valid email address and server in the appropriate fields.

You can also select whether you want TrashScan to listen on the HTTP, FTP, and TELNET channels.

If you want TrashScan to beep and come to the front when a scan is detected, check the "Alert" box. Otherwise, TrashScan will remain silent and in the background.

If you would like, TrashScan can send you an email alert when problems

arise. This should be especially helpful in server environments, in which machines may be left unattended for long periods of time. Just check the "Mail Alert" box.

You should restart TrashScan immediately after making any changes to make sure they take effect.
