## Description

TealPrint is a universal printing system for Palm OS that supports both graphics and native text. It provides stand-alone printing functionality for screen dumps, printing from the system text clipboard, and printing data from the system MemoPad, ToDo List, Datebook, and Address Book applications.

In addition, it provides an easy but flexible standard interface for printing from third-party applications who wish to add printing functionality to their programs.

The TealPrint system supports HotSync printing to any Windows-supported printer through a desktop PC. This is the preferable solution for most customers. It can also support direct connections to serial, parallel, and infrared printers with appropriate drivers and/or supported cable adapters. If you require a direct printing solution, please confirm that your printer is supported and test your connection before registering TealPrint.

## Contents

This archive contains the following files:

### Program files:

TEALPRNT.PRC	The TealPrint program file
TP_SPOOL.PRC	Universal spooling printer driver for HotSync printing
TP_GENE.PRC	Universal text-only direct serial/IR printer driver
PCSPPOOL.EXE	HotSync printing PC-Spooling Manager
COURI_MD.PRC	Courier medium-sized bitmap printer font (fixed space)
ARIAL_MD.PRC	Arial medium-sized bitmap printer font (sans serif)

### Document files:

PRNTDOC.PDF	This document in Adobe Acrobat (PDF) format
PRNTDOC.HTM	This document in HTML format (sans images)
PRNTDOC.PRC	This document in TealDoc format
REGISTER.HTM	TealPoint Registration form in HTML format
REGISTER.TXT	TealPoint Registration form in text format

## Installing

Use the Pilot installer to install the program file **TEALPRNT.PRC**. It will appear on the Palm Computing device after the next HotSync. This manual is also provided in this archive as the PalmPilot document **PRNTDOC.PRC**, which can be installed and viewed with our other application TealDoc.

Instructions on how to use the Palm installer are in the Palm Handbook that came with your Pilot, PalmPilot, Visor or WorkPad.

You will also need to install an appropriate printer driver for the printer you wish to support. To support printing from your HotSync cradle to any Windows-supported printer, install **TP\_SPOOL.PRC**. To use this option, you will also need **PCSPPOOL.EXE**, the PC-side spooling manager, but it needs no special installation beforehand. See the section below under Using the Program for more detailed instructions on how to HotSync print.

If you wish to print directly to a printer through a cable or IR link, you will need a driver that matches your particular printer. You do not need this additional driver for HotSync printing. A generic serial/infrared printer driver, **TP\_GENE.PRC**, is provided for universal text-only printing. This driver supports any printer that accepts raw text for input, printing in that printer's native default font.

To print graphics, graphic with selectable fonts, or to print text on printers which do not support raw text, you will need an appropriate printer driver that matches both your printer and connection (eg, serial, or infrared). Drivers exist for Epson-FX compatible printers and HP PCL printers. Visit our website for a full list of drivers currently available.

Once you have graphic printing working, you may also wish to install some bitmap print fonts. These fonts can be fairly large memory-wise, and can only be used when printing text in graphics mode. Two fonts, Arial and Courier, are included in this package in medium sizes. Further instructions on how to select and use bitmap text fonts appear later on in this document.

## Components

The TealPrint printing system consists of five major components, the TealPrint **Main Application**, **Printer Drivers**, **Bitmap Print Fonts**, **HotSync Spooling Manager**, and **Host Applications**.

### ***TealPrint Main Application***

The TealPrint main application appears as an icon on your applications launcher screen. It controls all print operations and communications with the printer drivers. It also offers many built-in printing tools such as screen dumps, printing from the clipboard, system profiling, and printing data from the four main Palm applications.

### ***Printer Drivers***

To communicate with individual printers, TealPrint uses printer-specific modules known as printer drivers. Printer drivers are actually small applications that know how to talk to a particular printer in its own digital language. While printer drivers appear as icons on the applications launcher screen, you rarely, if ever, need to run a printer driver directly.

When printing to a printer directly connected to your organizer through cable or infrared link, you need a driver which matches your printer. When HotSync printing, however, you should use the HotSync virtual printer driver **TP-Spool**.

### ***HotSync Spooling Manager***

When HotSync printing, TP-Spool doesn't actually communicate with your printer, but instead generates a file which is interpreted by the virtual printer engine in the HotSync Spooling Manager, **PCSPool.EXE**, which interprets the file on the PC and translates it into Windows calls and sends the information to your default Windows printer.

### ***Bitmap Print Fonts***

TealPrint supports printing text data using either native printer fonts or as graphics sent to the printer. In the former, raw text is generated and word-wrapped by TealPrint and sent to the printer as simple text. The font and style of the text is left up to the printer, which typically uses a fixed-space font such as Courier, rendering text which resembles the output of a typewriter.

Printing in graphics mode, however, allows TealPrint to render the text itself, giving the user more flexibility in the style and sizing of the text. The standard PalmPilot screen fonts are far

too low resolution for most purposes, however, looking very jaggy when printed at reasonable sizes on at printer resolution. Bitmap Print fonts are higher resolution fonts which allow printing in graphics mode and still achieve good-looking results.

## **Host Applications.**

While TealPrint offers many built-in printing functions, it really shines when directly supported by an external application. TealPhone, TealDoc, and TealPaint already offer direct TealPrint support. Other applications will follow.

## Interface

### **Main Screen**

Run TealPrint by choosing its icon from the Palm applications screen. The TealPrint main display screen shows the current configuration and offers universal tools for basic printing. It also allows one to set current modes, adjust basic print settings, and change driver-specific settings.

### **Modes**

At the top of the main TealPrint screen, the following selections are adjustable:

#### *Driver*

Lets you set the current active printer driver, from the list of all currently installed printer drivers.

#### *Paper*

Lets you select paper sizes or change the default margins for all paper sizes supported by your printer. You may need to change this option when, say, printing an envelope or on odd-sized paper if the printing application does not provide this option.

#### *Graphics Mode*

Lets you select the current graphics printing mode, as defined by the printer driver. Typically, this setting is used to change graphic printing resolution or enable a special printing mode such as transparency or photo printing. This option is not available if the printer or printer driver does not support graphics, and only affects printing in graphics mode.

#### *Text Mode*

Lets you select the current text printing mode, as defined by the printer driver. Typically, this is used to support printing with different internal printer fonts or for landscape text printing, if supported. If the current printer or printer driver does not support printing in a raw text mode, this option is not available. This option does not affect text printed in graphics mode.

## Configure Options

Lower on the main screen, other configuration and print options are available.

### *About*

Displays information about the active version of TealPrint.

### *Settings*

Adjusts the current default graphic and text printing settings

### *Driver Info*

Displays information about the active driver, if available.

### *Driver Settings*

Allows setting of driver-specific options, like communications mode and speed.

## Print Tools

### *Text*

Brings up a text-editing screen that lets you enter, edit, and print some short text. Perfect for a quick note or label.

### *Clipboard*

Prints any text "Copied" or "Cut" to the Palm text clipboard. Useful to print text from any program that supports cut and paste.

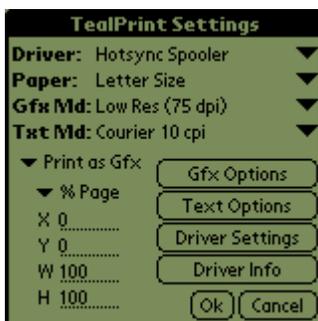

### *Screen-Grab*

Allows dumping the PalmPilot display to the printer from within another program. Requires a printer and printer driver that supports graphics.

### *Data*

Accesses controls for printing data from the Standard PalmPilot Datebook, Address Book, MemoPad, and To-Do List, applications and for printing several internal test images.

## Settings Screen

The settings screen allows you to set various default options for printing text and graphics. These options affect the basic printing tools in TealPrint and apply to most other programs as well who print through the TealPrint interface. Programs that perform more task-specific printing tasks may choose to override some or all of these options with its own preferences or options.

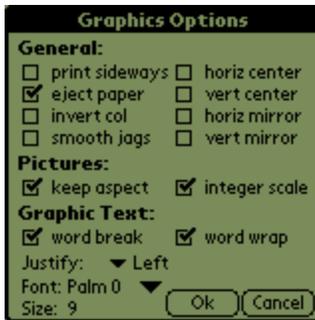

## Print As Txt/Print as Gfx

This setting allows you to select whether the printer prints the incoming page in graphics mode or as native printer text. The latter is much faster for printing basic text documents, takes much less memory when printing, but limits you to the standard printer font and does not support graphics or most effects.

## Print Size (X Y W H)

Lets you scale an image down from its default print size. Normally, TealPrint considers the full region on the paper within the margins to be printable. You can shrink this printable region, and any printed imagery or text will be resized to fit the new space. Note that when printing in graphics mode, the text will shrink to fit the new smaller space, remapping fonts if necessary. When printing as Text, the text will re-wrap to fit the smaller space but cannot scale down.

## Gfx Options

The following special options are available when printing in graphics mode.

### *Print Sideways*

Prints the image in Landscape mode (sideways) rather than portrait

### *Eject Paper*

Sends a command to eject paper out of the printer after printing, if optional. Some printers, however, always automatically eject a page after printing.

### *Invert Colors*

Prints the page as a black and white negative

### *Smooth Jaggies*

Rounds the corners of line drawings or text to get rid of graphic "jaggies". This options slows printing considerably, however, and will darken or distort images with shading or dithering.

### *Horizontally Center*

Centers a image or block of text horizontally on the page. To have an effect, the printable area has to be set to less than a full page width.

### *Vertically Center*

Centers a image or block of text vertically on the page. To have an effect, the printable area has to be set to less than a full page height.

### *Keep Aspect*

Normally, bitmap images are scaled vertically and horizontally to keep proper proportions. Without this option checked, the image will be stretched to fill all available space even if the image is stretched out of proportion.

### *Integer Scale*

When this option is set, images are scaled to maintain constant pixel sizes, improving the look of line drawings and detailed images, even if images may print smaller than the total available area.

### *Word Break*

When printing graphic text, this option forces line breaks to occur only on word boundaries. When this option is not checked, lines may wrap anywhere.

### *Word Wrap*

When printing graphic text, this option allows long lines to wrap to the next line. When not checked, long lines are truncated.

### *Justify*

Centers or left or right-justifies graphic text.

### *Font*

When printing text in graphics mode, TealPrint allows you to choose which bitmap font to use. Click on the drop-down triangle next to the font name to bring up the font selection screen.

### *Font Faces*

Four standard Palm fonts are available (only three on Pre-III PalmPilots). However, these fonts are designed for the Palm screen and are small when printed. Installed TealPrint font files expand the choice of available fonts with higher resolution fonts designed for printing.

### *Font Size*

Graphic fonts can be printed at some multiple of its minimum size, where each pixel of the font corresponds to a pixel of the printer output. Thus, when printed at its smallest size, a font appears at its highest resolution; the full resolution of the printer. When text is printed at a multiple of this base size it appears larger, but will show pixel "jaggies" when blown up too large. The "Smooth Jaggies" option can be used to reduce this effect, but looks better with some fonts than others.

## Text Options

The following special options are available when printing in text mode.

### *Horizontally Center text*

Centers a image or block of text horizontally on the page. To have an effect, the printable area has to be set to less than a full page width.

### *Vertically Center text*

Centers a image or block of text vertically on the page. To have an effect, the printable area has to be set to less than a full page height.

### *Eject Paper after printing*

Sends a command to eject paper out of the printer after printing, if optional. Some printers, however, always automatically eject a page after printing.

### *Wrap Long Lines*

When printing graphic text, this option allows long lines to wrap to the next line. When not checked, long lines are truncated.

### *Break lines on word bounds*

When printing graphic text, this option forces line breaks to occur only on word boundaries. When this option is not checked, lines may wrap anywhere.

### *Justify*

Centers or left or right-justifies graphic text.

## Driver Settings Screen

Printer driver options can vary from driver to driver. In general, here are some settings that tend to be present in drivers we offer:

### *Baud Rate*

Set the speed and type of communication to the printer. Rates may be for serial or IrDA (Infrared) communication.

### *Send Slow*

Slows the output of data through the serial port in discrete packets to avoid data loss associated with some serial-to-parallel adapter cables.

### *RTS/CTS handshaking*

Enables hardware handshaking for serial communication

### *XON/XOFF handshaking*

Enables software handshaking for serial communication

### *EVEN/ODD parity*

Set bit parity for serial communication

### *Show status*

Shows printing communication status at the top of the current display. This may not be desirable running with program which dump the unbuffered contents of the current screen, as the status may appear in the printed image.

### *Beep status*

Plays in intermittent "click" while printing to indicate printing is in progress

## HotSync Printing

HotSync printing allows one to print to any Windows-supported graphics printer by buffering printed information in the PalmPilot's memory, and sending it to the TealPrint Spooling Manager after a HotSync operation.

Most printing operations happen immediately when selected. HotSync printing is the exception. Similar to the way the standard 'mail' app that comes on the PalmPilot works, HotSync printing lets you print your pages on the PalmPilot first, sending them to the printer later only when you HotSync.

### Steps

To print an image or document through the HotSync cradle:

#### 1) Run Spooling Manager

First run the included program PCSPOOL.EXE. This program monitors the system HotSync folders and sends any incoming spooled print jobs to your Windows default printer. You can start this program before every print session, or even drag it to your Windows startup folder so that it's ready whenever you need to print. The program starts minimized on your task bar, and comes up automatically when it's time to print. It also features an optional "Print to Screen" mode that allows previewing of incoming print jobs without sending them to the printer.

#### 2) Select the Spooling Print Driver on the Palm

On the Palm side, you will need to install the SPOOLING printer driver TP-SPOOL.PRC and select it as your current printer driver from within TealPrint. It supports a number of options including resolution and status display.

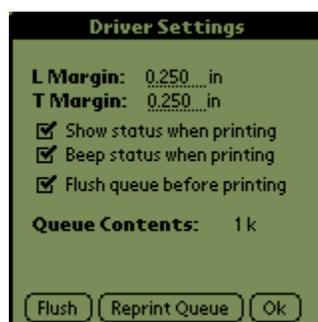

#### 3) Print to Data Queue

With the spooling driver activated, run text and graphics print tasks. The driver saves the generated printed data in an internal buffer, or "queue".

#### 4) HotSync

To send a queued print job to the printer, simply HotSync your palm device afterwards with PCSPOOL.EXE already running. Make sure that the Palm desktop settings are set backup Palm database files.

### Queue Management

By default, the spooling driver clears the print queue before every print job. This means that you must HotSync after every print operation to send the last job to the printer. You can override this option by turning off the automatic "flush" option under TP-SPOOL's driver settings. Note that when you do this, you must remember to manually flush the queue when you are done to prevent reprinting the jobs left in the queue the next time you go to print a page. If you want to print another copy of our last print job, you can use the

"Reprint Queue" button to tell the system to send last job in the queue to the printer again at the next HotSync.

Queued print jobs can take a fair amount of available free memory, particularly when printing graphics. Higher resolutions will require more memory as well. The TP-SPOOL print driver supports a number of different resolutions.

## ***Graphics Resolution***

For best results, set the Graphics Mode resolution to an even fraction of your printer's actual resolution. For instance, if your printer prints at 360 dpi, printing graphics at 90 or 180 dpi is recommended. For a 300 dpi printer, try the 75 or 150 dpi settings on the driver. For text, you can get the fastest and best-looking results with a minimum of memory usage by printing in raw text mode.

## ***Helpful Hints***

1) The PC Spooler monitoring program *must* be running the first time you HotSync after printing for the queued data to be sent to the printer. (If you forget to run the program, you can always print again by choosing the 'Reprint Queue' button under the driver settings page of the TP-Spool printer driver, and then HotSyncing again, this time with the monitoring program running in the background on the PC.)

2) Note that the TP-Spool driver defaults to clearing the queue before each printing operation. If you want to perform multiple printing operations before HotSyncing, flush the queue manually and then turn off the automatic 'flush' setting in the TP-Spool print driver settings before printing. You should manually flush the queue after printing to free up the memory used and prevent the queued data from printing again later the next time you print.

## **Direct Printing**

To use TealPrint directly with a printer, you'll need a proper adapter or cable to connect your PalmPilot to your printer if it does not support infrared communication.

Note: Please don't experiment with your own cables or adapters unless you know what you're doing. While creating your own cables may be pretty straightforward to someone with a technical background, don't rely solely on the information below if you're at all unsure about what will or will not work.

### ***Infrared (IrDA) Printers***

Printers that have a built-in IrDA port do not require any cabling. They do require a printer driver with an option to output signals from the Palm's IR port, and one that speaks a language the printer can understand. The generic text printer driver supports IR in three different connection speeds, and communicates with IR printers designed to be connected to Laptop PCs. Custom IR printers designed for specific devices like digital cameras may not work with the generic IrDA driver.

For printers without built-in IrDA support, you may be able to purchase an IR adapter. See "PC Parallel Printers" below for more information.

## **PC Serial Printers**

Serial printers are generally easier to connect to your PalmPilot than Parallel printers, as the PalmPilot has a serial port in its base. As long as the serial printer can operate at a baud rate supported by your organizer, connection simply involves connecting the proper signals together. As PalmPilot HotSync connectors are not generally available, your best bet is to run a cable between your HotSync cradle and your printer, and simply print with your PalmPilot in the cradle. To do this, you need a converter that will connect the DB9-Female connector to your printer, routing the signals correctly. The exact wiring depends entirely on the printer.

You can also take advantage of an existing serial cable for your printer, which is designed to plug into the DB25-Male or DB9-Male serial cable at the back of your PC. If you have one of these, then all you need is a short DB9-to-DB9 Null modem cable to go in between the HotSync cradle and the printer cable. The null modem cable is necessary to swap the send a receive lines along the way, so that the PalmPilot looks like a PC, rather than a peripheral that plugs into a PC.

If you're lucky, you can find a null modem cable with two DB9 Male connectors. If not, you might need to also get one or two DB9 gender changers and/or DB9-to-DB25 serial adapters in addition to a null modem cable with different connectors. You probably won't find the complete cable at your local software store, but you can probably find it online at somewhere like [www.cablewholesale.com](http://www.cablewholesale.com), or you can make one yourself with about \$5 in parts. If you purchase a cable, be sure to check a wiring diagram for the cable first before purchasing it or hooking it up to your Palm.

Once you have a DB9M to DB9M null modem cable, plug in your HotSync cradle on one end and the cable that goes to your printer on the other.

In our tests with the DYMO EL60 Labelwriter, we've found that the following cable adapter pinout worked for us:

DB9M			DB9M
RX	2	-----	3 TX
TX	3	-----	2 RX
GND	5	-----	5 GND
DSR	6	-----	6 DSR
RTS	7	-----	8 CTS
CTS	8	-----	7 RTS

Note that most null modem cables cross over DSR and DTR instead of connecting them straight across the way we have this cable wired up. As serial printers are not all that common, we check our website for up to date compatibility information as we get it. Other printers may be able to work with off-the-shelf null modem cables.

## **PC Parallel Printers**

Most PC printers have parallel ports on them with a 36-pin Centronics connector. For these printers, your best bet is to buy an off-the-shelf serial-to-parallel adapter cable, such as the Greenwich Instruments GA945PP (\$49 at [www.NWT.com](http://www.NWT.com)), which will connect any PalmPilot except the Palm V, and Visor directly to a parallel printer.

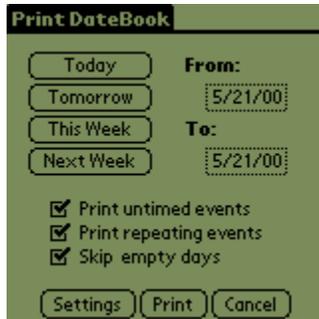

Note that several similar adapters exist and will work. The Greenwich cable is nice in that it's both affordable and runs at 57600 baud. Some other cables are slower, operating at 38400 instead. A fancier, but more expensive solution is to get an Infrared adapter like the ActiSys ACT-IR 100M Printer Adapter (\$110 at [www.cyberguys.com](http://www.cyberguys.com)). Designed to add an IR port to any Parallel printer, this device is compatible with any PalmPilot with beaming capability, and even adds a pass-

through so you can keep your PC connected at the same time. Note that at this time, the JetEye IR adapter does not work with TealPrint.

## Printing data from the Standard applications

TealPrint supports printing from the four basic applications. You can access these tools from the "Data" button on the main screen.

### ***Datebook***

Allows you to print an agenda of items for any specified range of days. You can optionally hide untimed events, repeating events, or days without any events.

### ***Address Book***

Prints the full contents of any single address book entry.

### ***To-Do List***

Prints all To-Do items, or all items within a selected category.

### ***Memo Pad***

Prints the full contents of a selected memo

### ***System Info***

Prints detailed system information including User, Processor, Operating system, memory heaps, and all installed files

### ***Tests***

Prints four various sequences designed to test special effects and features in the TealPrint's graphics and graphic-text subsystem.

## Printing from TealPrint-friendly programs

The exact interface for printing from a TealPrint-friendly program can vary from program to program, but typically it goes something like this:

1. For direct printing, connect the Palm cable or bring its infrared port in range of the printer
2. Choose a 'Print' Option from the app's menu or control screen
3. Configure options in the TealPrint settings screen, including setting text/graphics print mode
4. Click 'Print'.
5. Keep the Palm connected until printing is complete

The contents of the settings screens may vary from app to app. For most apps, you can vary the size, rotation, and appearance of the output when printing in text mode, but programs may override some settings if they have specific formatting needs, such as printing labels for established label sheets. Also, when printing in text mode, formatting and sizing are more restricted and may vary from printer to printer.

## Printing data from non TealPrint-friendly programs

When programs have not been designed specifically with TealPrint in mind, printing may still be possible using some of TealPrint's print options.

For printing graphics, use the 'Print Screen' option in TealPrint. Functioning like a camera's timer feature, this lets you set an elapsed time to start. Once you set it in TealPrint, you have time to go to the other app and go to the screen you wish to print. This option dumps the screen to the printer as a graphic page.

To print other data, you can often use the 'Print Clipboard' option instead. Most programs typically have the ability to drag-select text and copy it to the system clipboard using a 'copy' menu item. Once you do this, you can either print it directly using the 'Print Clipboard' option in TealPrint, or paste it in the 'Print Text' screen first to allow you to do some editing first.

## Aborting Printing

To abort a print operation from a properly-written driver, press and hold down any physical "hardware" button on the PalmPilot, such as the PAGE-UP scrolling button.

## Using Graphic Fonts

When printing text in graphics mode, TealPrint has the ability to map the text to different fonts. Since the four built-in Palm fonts are designed for the small Palm screen, they lack resolution to print nicely smooth text when sent to the printer.

Fortunately, TealPrint supports installation of external fonts for graphics printing. Two medium-sized fonts, Arial and Courier, are included for this purpose. Install these .PRC files using the Palm Install Tool. Check the TealPoint website for font packs for other fonts and a full selection of font sizes. Actual printed font sizes are dependant on the resolution (DPI) of the graphics print mode being used.

Since bitmap fonts can take a large amount of memory, only one font size (measured in pixels) is included in each PRC file. This font will print in different measured sizes (measured in inches) depending on the resolution of your printer. The included fonts are designed to print at a reasonable size when printed at 200-360 dpi. TealPrint can scale up fonts to print at larger sizes, but when scaled up too high they tend to exhibit 'jaggies'.

Once you have installed an external bitmap font, you can select it as your preferred default font under the graphics settings page. Note that this font style and size only applies when it is not overridden by the printing application, and that the system may remap to a smaller font if you print a page at a scaled-down size.

Other font faces and sizes will be made available for download on our web site, subject to availability and our customer's needs.

## Appendix A - Troubleshooting

*I'm trying to HotSync print, but nothing happens when I HotSync*

Make sure that you're running the PC-Spool monitoring program before you HotSync. If not, run it, choose "Reprint Queue" from the driver settings menu in TealPrint, and HotSync again.

*I did that, and it still isn't doing anything.*

Set your "custom" options to "System: Palm overrides Desktop". Then hotsync. If it still does nothing, un-minimize the spooling program and look at the file path where it's looking for your spooling file. Look for the file "TealPrint\_Spool\_File.PDB" in one of the backup folders and make sure it's getting copied back to your PC correctly by the Hotsync system.

*I'm using a direct connection. I can't print at all*

Make sure your printer is on and properly connected and that your printer driver settings match your cable and connection. If this still does not work, run the printer driver directly from the applications menu, and print a test page directly from the driver to check the connection and settings. If you are using a parallel printer converter cable, your serial settings must match what the cable was designed for.

*It printed before. Now it doesn't*

If you're running a parallel converter cable, try disconnecting the cable temporarily from both the printer AND the Palm and waiting a few seconds to let the converter circuitry reset.

*Graphics are not showing up*

Make sure you have your settings set to "Print as Graphics" and that your printer and printer driver both support graphics and are correct for each other.

*All I get is graphic junk when sending graphics*

Make sure your printer driver is correct for your printer, that your transfer speed set in the driver is correct.

*When trying to hotsync print I run out of memory*

When hotsync printing, the buffered data is dumped to a temporary file for transfer at the next hotsync. This file can be quite sizeable, especially for graphics printing. If printing text, try printing in text mode, which takes less space. Otherwise, you'll need to decrease the size of the page being printed, lower the resolution, or delete files and data off the Palm to free up

more memory.

*When printing raw text, most of the text is fine, but European characters are coming up as funny symbols.*

Your printer may use a different character set for European characters. Check your printer driver settings. If it support different character sets, try switching to another character set. For example, PCL printers default to using the PC-8 font set, which contains most European characters, but some only in lower case.

*I sometimes get junk or missing/wrong characters when printing through a serial or parallel connection.*

Try printing using a "Send Slow" and/or hardware (CTS) handshaking driver options, if available.

*When I try printing to an IR printer, the connection just times out*

Make sure the printer driver is set up to communicate in Infared rather than serial. Turn on status display in the driver settings, if available, to further diagnose the problem.

## Appendix B - Revision History

Version 1.22 5/29/00

- Added support for installation into Flash RAM
- Added *About* and *Register* drop down menus

Version 1.20 5/22/00 Initial Release

## Appendix C - Credits

Manual by Vince Lee, Tex Tennison, and Diane Dybalski

## Appendix D - Contact Info

TealPrint by TealPoint Software

TealPoint Software  
454 Las Gallinas Ave #318  
San Rafael, CA 94903-3618

Please visit us at [www.tealpoint.com](http://www.tealpoint.com), or email us at [contact@tealpoint.com](mailto:contact@tealpoint.com).

*We look forward to hearing from you.*

## Appendix E - Registering

Currently, you may register by snail mail, electronically through our website at [www.tealpoint.com](http://www.tealpoint.com) with a credit card and a secured server, or through PalmGear HQ at 1-800-741-9070. For the first option, the enclosed registration form is provided for your convenience. You may use this form or simply send the following to the address above.

- Product Name
- E-Mail Address
- HotSync User ID (Pilot Name Required for Passkey generation. It can be found on the main screen of the HotSync application on the Pilot as "Welcome \_\_\_\_\_" or in the corner on a PalmIII or higher)

- Check (drawn off a US Bank) or Money Order for \$19.95 US to TealPoint Software

## Appendix F - Disclaimer

We at TealPoint Software are committed to providing quality, easy-to-use software. However, this product is provided without warranty and the user accepts full responsibility for any damages, consequential or otherwise, resulting from its use.

This archive is freely redistributable, provided it is made available only in its complete, unmodified form with no additional files and for noncommercial purposes only. Any other use must have prior written authorization from TealPoint Software.

Unauthorized commercial use includes, but is not limited to:

- A product for sale.
- Accompanying a product for sale.
- Accompanying a magazine, book or other publication for sale.
- Distribution with "Media", "Copying" or other incidental costs.
- Available for download with access or download fees.

This program may be used on a trial basis for 30 days. The program will continue to function afterwards. However, if after this time you wish to continue using it, please register with us for the nominal fee listed in the program.

Thank you.
