

**PalmLotto** is a dumb product of a non-professional programmer who likes to play Lotto once in a while.

It requires cbas-pad (available on various software sites for the Pilot) as it is written in basic.

**As I am not willing to take any responsibility for this program, any waiver ever written anywhere applies hereto. The use of this program is the full and only risk of the user!!!**

**How to install :**

open prog.doc, which is a winword file.  
Mark everything and copy into clipboard  
open Pilot Software  
go to notes  
click on new  
paste from clipboard into new note  
hotsync pilot  
start pilot  
go to notes on pilot  
open the lotto note you generated as above  
mark all  
copy to clipboard  
open cbas-pad  
go to new  
paste into new  
goto select all  
goto execute  
the program should be running now

A dialog box pop's up, asking you for the number of draws (draw = set of 6 figures). Answer by writing the required number on the number pad. Tap "ok". The desired number of draws will now come up, one after the other, giving you time to fill in the boxes on paper wherever you are with your pilot. Each draw has to be confirmed by a tap on "ok". Finally the program wishes you luck and that's it.

If you like, you can delete the note containing the program, as it is from now on under cbas pad available

In case you have any suggestions to make this dumb thing smarter, I appreciate to receive emails under
