

## Flintstone

version 1.00

by

Peter S. Bryant

The flintstone font is a display font for use with any Postscript compatible printer. It is primarily a display font and is not appropriate for general purpose text applications.

Flintstone Plain at 24 points  
**Flintstone** Bold at 24 points  
*Flintstone* Italic at 24 points  
Flintstone Underlined at 24 points  
**Flintstone** Outline at 24 points  
**Flintstone** Shadow at 24 points

Contained in the Flintstone Package:

1. "Flint" -- Postscript laserFont File
2. "Read Me" -- MacWrite Document describing Flintstone
3. "Flintstone.AFM" -- Font Metrics File
4. "Flintstone.BMAP" -- Screen Fonts of Flintstone (12,24,48,72 points)

This font looks particularly good in the shadow option. This is not a complete font, most special characters are not included (as this is a display Font) and uppercase and lowercase characters appear the same.

To use this font, simply install the bitmap fonts into your system file using Apple's "Font/DA mover", then copy the file "Flint" into your system folder. You have now installed the Flintstone font and are ready to use it for printing.

The bitmap fonts have not been fine tuned, so they do not print very well on the Imagewriter printers. If you wish to edit them, do so. We recommend

Fontastic Plus\_ by Altsys. When you edit the bitmaps **DO NOT** change the kerning or spacing information, as this will throw off the actual printed document.

**SHAREWARE NOTICE**

This font is provided to you as a shareware product. This means that you can use it for 10 days. If you decide that you would like to keep it, then please send in \$5.00. If on the other hand you do not decide to keep it, then delete it from your files and forget it ever existed. I think that \$5.00 is a reasonable price for a font. So please send in the fee.
