$⁵#⁶#⁷

&product.

K⁸K⁹

 This is general help for the &product.

 The &product. uses the IBM User Interface Class Library (ICLUI) to implement features that are common to most <u>Presentation Manager</u> (PM) programs, like a menu bar containing   <u>File</u> and <u>Edit</u>   and **Help** action bar items.   You can use the &product. as a template from which to build your own ICLUI applications. Compare this code with the code from the Basic PM Application in the Project Smartz catalog to see how much easier it is to implement a user-interface with ICLUI.

 The &product. is fully help-enabled, and uses string resources, instead of string literals, to facilitate translation.

 To use the &product., open a file by selecting   <u>Open</u> from the **File** pull-down.   The file is opened, and then immediately closed. Subsequently, any menu item you select is displayed as text in the client   window.

Message Help

 The file you selected could not be opened for one or more of the following reasons:

- The file could not be found.   It may have been deleted, renamed, or moved.
- There are too many open files.   If this is the case, increase the FILES= number in your CONFIG.SYS.
- Access to the file was denied.   Check the file's attributes and make sure that you have write access to the file.
- The file may be in use by another process.   Stop all processes that could be using the file and try opening the file again.
- The disk is full.

 Check that none of the above conditions is true and try the opening the file again.
