

MenuFrame

Frame width : The frame width.

Frame height : The frame height.

Frame initial X : The initial left position of the menu frame.

Frame initial Y : The initial top position of the menu frame.

Frame title : The frame title (default is "Menu").

Target : You have 4 defined choices ('_self', '_blank', '_top', '_parent', for instance select '_self' to open the linked page in the same window or '_blank' to open it in a new window; see the Help for further details). If you use frames you can select 'frame_name' and enter the destination frame name instead of 'frame_name'.

Add/Remove : Set the MenuFrame **texts** and **links**. Each text is associated with one link. For instance enter 'Altavista' as a text and 'http://www.altavista.com' as a link. The link you enter must be an URL (Web address). It can be an absolute URL, like 'http://www.taijisoftware.com', or a relative one like a page name from your site, 'home.html' for instance. Then click **Add** to add these text and link. Add other texts and links. If you want to remove a text/link, select it and click **Remove**.
