

# Easy Applet Builder 1.7

## *Read this first*

Welcome in Easy Applet Builder ! Here is a summary of how to proceed to build easily an applet : Click 'Applets' on the explorer on the left to view the entire applets list. Choose the applet you want and double click on it. Fill out the parameters, show a preview in the default browser by clicking 'Show preview', change parameters if you are not satisfied... When the applet is customized as you want, click 'HTML' to view the 'HTML and needed files' window. Click 'Save needed files into...' to save the applets file(s) and possible image or sound files. At the end , click 'Copy HTML into clipboard' and paste it in your web page html code.

For further details, please read the *Tutorial*.

**If you have troubles with this software then execute 'Live Support' in the Help menu before emailing me.**

## *What are applets ?*

Applets are components you add to your Web pages. Since they are issued from a complete programming language they are more powerful than scripts like Visual Basic Scripts or Java Scripts. Applets are written in Java™, a universal language that allows you to use applets on any Web browser that includes a java interpreter. It's the case for most of the actual browsers (like Internet Explorer, Netscape Communicator and Navigator...) With the Java programming , your website is secured. Indeed, applets can't read or write on your hard disk or connect anywhere on the Web.

For more FAQ about Java applets you can read the FAQ on line, at <http://www.taijisoftware.com>.

## *What is Easy Applet Builder ?*

Learning Java programming is long and difficult, so it is useful to use applets previously programmed for you . The applets must be very customizable to provide the effects you want. Easy Applet Builder provides a visual and intuitive interface to set the parameters of many various Java applets made by TaijiSoftware™ easily. Thanks to Easy Applet Builder you can create an applet in less than one minute, test the result and if you are satisfied copy the HTML code and all needed files. It's easy, try it !
