If you want to have different fonts depending on the outcome of an if-then-else statement you should have 2 formulas, one on top of the other. This is an example of the formulas:

Name: @Formula1
Text: if {file.field} = 2 then "This is OK" else ""

Name: @Formula2
Text: if {file.field} = 2 then "" else "This is OK"

The one formula would be in one font & the other in a second font.
