# Winsock Control

The **Winsock** control, invisible to the user, provides easy access to TCP and UDP network services. It can be used by Microsoft Access, Visual Basic, Visual C++, or Visual FoxPro developers. To write client or server applications you do not need to understand the details of TCP or to call low level Winsock APIs. By setting properties and invoking methods of the control, you can easily connect to a remote machine and exchange data in both directions.

**TCP Basics**

The Transfer Control Protocol allows you to create and maintain a connection to a remote computer. Using the connection, both computers can stream data between themselves.

If you are creating a client application, you must know the server computer's name or IP address (**RemoteHost** property), as well as the port (**RemotePort** property) on which it will be "listening." Then invoke the **Connect** method.

If you are creating a server application, set a port (**LocalPort** property) on which to listen, and invoke the **Listen** method. When the client computer requests a connection, the ConnectionRequest event will occur. To complete the connection, invoke the **Accept** method within the ConnectionRequest event.

Once a connection has been made, either computer can send and receive data. To send data, invoke the **SendData** method. Whenever data is received, the DataArrival event occurs. Invoke the **GetData** method within the DataArrival event to retrieve the data.

**UDP Basics**

The User Datagram Protocol (UDP) is a connectionless protocol. Unlike TCP operations, computers do not establish a connection. Also, a UDP application can be either a client or a server.

To transmit data, first set the client computer's **LocalPort** property. The server computer then needs only to set the **RemoteHost** to the Internet address of the client computer, and the **RemotePort** property to the same port as the client computer's **LocalPort** property, and invoke the **SendData** method to begin sending messages. The client computer then uses the **GetData** method within the DataArrival event to retrieve the sent messages.

# BytesReceived Property

Returns the amount of data received (currently in the receive buffer). Use the **GetData** method to retrieve data.

Read-only and unavailable at design time.

**Syntax**

*object*.**BytesReceived**

The *object* placeholder represents an <u>object expression</u> that evaluates to an object in the Applies To list.

**Return Value**

Long

# LocalHostName Property

Returns the local machine name. Read-only and unavailable at design time.

**Syntax**

*object*.**LocalHostName**

The *object* placeholder represents an object expression that evaluates to an object in the Applies To list.

**Return Value**

String

# LocalIP Property

{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbproBooksOnlineJumpTopic;vbproLocalIPC"}          {ewc HLP95EN.DLL,DYNALINK,"Example":"vbproLocalIPX":1}          {ewc HLP95EN.DLL,DYNALINK,"Applies To":"vbproLocalIPA"}          {ewc HLP95EN.DLL,DYNALINK,"Specifics":"vbproLocalIPS"}

**Syntax**

*object*.**LocalIP**

The *object* placeholder represents an <u>object expression</u> that evaluates to an object in the Applies To list.

**Data Type**

String

# LocalPort Property

Returns or sets the local port to use. Read/Write and available at design time.

- For the client, this designates the local port to send data from. Specify port 0 if the application does not need a specific port. In this case, the control will select a random port. After a connection is established, this is the local port used for the TCP connection.

- For the server, this is the local port to listen on. If port 0 is specified, a random port is used. After invoking the **Listen** method, the property contains the actual port that has been selected.

**Syntax**

*object*.**LocalPort** = *long*

The *object* placeholder represents an object expression that evaluates to an object in the Applies To list.

**Data Type**

Long

**Remarks**

Port 0 is often used to establish connections between computers dynamically. For example, a client that wishes to be "called back" by a server can use port 0 to procure a new (random) port number, which can then be given to the remote computer for this purpose.

# RemoteHostIP Property

{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbproBooksOnlineJumpTopic;vbproRemoteHostIPPropertyC"}          {ewc HLP95EN.DLL,DYNALINK,"Specifics":"vbproRemoteHostIPPropertyS"}          {ewc HLP95EN.DLL,DYNALINK,"Applies To":"vbproRemoteHostIPPropertyA"}          {ewc HLP95EN.DLL,DYNALINK,"Example":"vbproRemoteHostIPPropertyX":1}

Returns the IP address of the remote machine.

- For client applications, after a connection has been established using the **Connect** method, this property contains the IP string of the remote machine.
- For server applications, after an incoming connection request (ConnectionRequest event), this property contains the IP string of the remote machine that initiated the connection.
- When using the UDP protocol, after the DataArrival event occurs, this property contains the IP address of the machine sending the UDP data.

**Syntax**

*object*.**Accept** *requestID*

The *object* placeholder represents an object expression that evaluates to an object in the Applies To list.

**Data Type**

Long

**Return Value**

Void

**Remarks**

The **Accept** method is used in the ConnectionRequest event. The ConnectionRequest event has a corresponding argument, the **RequestID** parameter, that should be passed to the **Accept** method. An example is shown below:

```
Private Sub Winsock1_ConnectionRequest _
(ByVal requestID As Long)
    ' Close the connection if it is currently open
    ' by testing the State property.
    If Winsock1.State <> sckClosed Then Winsock1.Close

    ' Pass the value of the requestID parameter to the
    ' Accept method.
    Winsock1.Accept requestID
End Sub
```

The **Accept** method should be used on a new control instance (other than the one that is in the listening state.)

# Accept Method, ConnectionRequest Event Example

The example shows the code necessary to connect a **Winsock** control using the TCP protocol. The code runs on the machine that is accepting the connection request. The **RequestID** parameter identifies the request. This is passed to the **Accept** method which accepts the particular request.

```
Private Sub WinsockTCP_ConnectionRequest _
(requestID As Long)
    If Winsock1.State <> sckClosed Then Winsock1.Close
    Winsock.Accept requestID
End Sub
```

# Bind Method

The **PeekData** method syntax has these parts

| Part | Description |
| --- | --- |

When a UNICODE string is passed in, it is converted to an ANSI string before being sent out on the network.

# Close Event

{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbevtCloseEventC;vbproBooksOnlineJumpTopic"}          {ewc HLP95EN.DLL,DYNALINK,"Example":"vbevtCloseEventX":1}          {ewc HLP95EN.DLL,DYNALINK,"Applies To":"vbevtCloseEventA"}          {ewc HLP95EN.DLL,DYNALINK,"Specifics":"vbevtCloseEventS"}

**Syntax**

*object_***Close( )**

The *object* placeholder represents an object expression that evaluates to an object in the Applies To list.

**Arguments**

None

# ConnectionRequest Event

Occurs when a remote machine requests a connection.

- For TCP server applications only. The event is activated when there is an incoming connection request. **RemoteHostIP** and **RemotePort** properties store the information about the client after the event is activated.

## Syntax

*object*\_**ConnectionRequest** (r*equestID* **As Long**)

The ConnectionRequest event syntax has these parts:

| Part | Description |
| --- | --- |
| *object* | An object expression that evaluates to an object in the Applies To list. |
| *requestID* | The incoming connection request identifier. This argument should be passed to the **Accept** method on the second control instance. |

## Remarks

The server can decide whether or not to accept the connection. If the incoming connection is not accepted, the peer (client) will get the Close event. Use the **Accept** method (on a new control instance) to accept an incoming connection.

# DataArrival Event

Occurs when new data arrives.

**Syntax**

*object*_**DataArrival** (*bytesTotal* **As Long***)*

The DataArrival event syntax has these parts:

| Part | Description |
|------|-------------|
| *object* | An <u>object expression</u> that evaluates to an object in the Applies To list. |
| *bytesTotal* | Long. The total amount of data that can be retrieved. |

**Remarks**

This event will not occur if you do not retrieve all the data in one **GetData** call. It is activated only when there is new data. Use the **BytesReceived** property to check how much data is available at any time.

# SendComplete Event

Occurs when a send operation is completed.

**Syntax**

*object_***SendComplete**

| Date | **vbDate** |
| Boolean | **vbBoolean** |
| SCODE | **vbError** |
| String | **vbString** |
| Byte Array | **vbArray + vbByte** |

**Remarks**

It's common to use the **GetData** method with the DataArrival event, which includes the *totalBytes* argument. If you specify a *maxlen* that is less than the *totalBytes* argument, you will get the warning 10040 indicating that the remaining bytes will be lost.

# GetData Method (WinSock Control), DataArrival Event Example

The example uses the **GetData** method in the DataArrival event of a **Winsock** control. When the event occurs, the code invokes the **GetData** method to retrieve the data and store it in a string variable. The data is then written into a **TextBox** control.

```
Private Sub Winsock1_DataArrival _
(ByVal bytesTotal As Long)
    Dim strData As String
    Winsock1.GetData strData, vbString
    Text1.Text = Text1.Text & strData
End Sub
```

# Keyword Not Found

{ewc HLP95EN.DLL,DYNALINK,"See Also":"vbproBooksOnlineJumpTopic"}

The keyword you've selected can't be found in Visual Basic Help. It's possible that:

- The keyword is misspelled
- You selected too much or too little text
- You asked for help on a word that is not a valid Visual Basic keyword.

The easiest way to get help on a specific keyword is to position the insertion point anywhere within the keyword you want help on and press F1. You do not need to select the keyword. In fact, if you select only a portion of the keyword, or more than a single word, Help will not find what you're looking for.

To use the built-in Help search dialog box, press the **Help Topics** button on the toolbar.

One option to possibly find what you're looking for is to view the ReadMe file that comes with Visual Basic. This document contains information regarding last-minute changes, additions, and deletions that did not make it into the final documentation.
