Crew Participates in Countdown Test

The STS-100 flight crew is at Kennedy Space Center, Fla., to participate in the Terminal Countdown Demonstration Test. STS-100 is targeted to launch April 19 to begin a mission to deliver and install a robotic arm to the International Space Station.

Press Releases

STS-100 Preflight Briefings Set for April 9

The STS-100 preflight briefings are slated for April 9, beginning at 8 a.m. CDT (13:00 GMT) at NASA's Johnson Space Center, in Houston, Texas. One of the aspects to be discussed during the briefing is the new robot arm that will be delivered to the International Space Station by STS-100.

NASA SkyWatch is a web-based Java application that provides sky watchers around the world with a visual picture of when and where the International Space Station, the space shuttle and other spacecraft can be seen with the unaided eye as they pass overhead.

Yes, you can still see the old, familiar text-based sighting opportunities lists!

[Shuttle](#) / [Station](#)

Another special feature of NASA SkyWatch is that it can accurately predict shuttle entry sightings. The application may be used to sight other satellites, such as the Hubble Space Telescope, by using readily available two-line element sets.

This "applet" uses up-to-the-minute data from Mission Control to project the path the spacecraft will make across the sky.

Please allow sufficient time for all files to download the first time you access NASA SkyWatch. You will be downloading approximately 300K of data, which can take 3 minutes or more on a 33.6 kbps modem connection. Significantly more time will be required (10 minutes +) with 14.4 kbps connections. Many files remain resident in the Internet cache on your hard drive and do not have to be downloaded again unless you clear the cache.

SkyWatch Tips

Check out STARSHINE sighting opportunities (deployed June 5, 1999 on STS-96) before it re-enters the atmosphere early next year!

NASA Flight Dynamics Officer introduces SkyWatch (streamed video):

STS-99 Overview

Mission:	Shuttle Radar Topography Mission
Shuttle:	Endeavour
Launch Pad:	39-A
Launch:	TBD (no earlier than October 7)
Window:	TBD
Landing:	TBD
Duration:	11 days
Orbit Inclination:	57 degrees

SRTM Patch

Official insignia of the Shuttle Radar Topography Mission.

The [Shuttle Radar Topography Mission](#) objective is to demonstrate the technology for obtaining high-resolution digital topographic mapping of the Earth. SRTM consists of a specially modified radar system that will fly onboard the space shuttle Endeavour during an 11-day mission in early October 1999.

[Inspections Delay STS-99 Launch](#)

Workers must remove the radar mapping equipment from Endeavour's payload bay to inspect shuttle wiring for possible damage. The STS-99 mission is delayed until at least early October.

[Mercury](#) | [Gemini](#) | [Apollo](#) | [Apollo-Soyuz](#) | [Skylab](#) | [Shuttle-Mir](#) | [Space Shuttle](#)

"NASA is deeply committed to spreading the unique knowledge that flows from its aeronautics and space research..."

Project Mercury

Initiated in 1958, completed in 1963, Project Mercury was the United States' first man-in-space program.

Project Gemini

The second U.S. manned space program was announced in January 1962. Gemini involved 12 flights, including two unmanned flight tests of the equipment.

Apollo-Soyuz

The mission started with the Russian Soyuz launch on July 15, 1975, followed by the U.S. Apollo launch on the same day. Docking in space of the two craft occurred on July 17, and joint operations were conducted for two full days. Both spacecraft landed safely and on schedule.

Project Apollo

"I believe this nation should commit itself to achieving the goal, before this decade is out, of landing a man on the Moon and returning him safely to Earth. No single space project in this period will be more impressive to mankind, or more important in the long-range exploration of space; and none will be so difficult or expensive to accomplish."

- John F. Kennedy

Special Joint Session of Congress

May 25, 1961

Pete Conrad Tribute

Pete Conrad's funeral was held Monday, July 19 at 11 am EDT at Fort Myers Chapel at Arlington National Cemetery.

Skylab

Designed for long duration missions, Skylab program objectives were twofold: To prove that humans could live and work in space for extended periods, and to expand our knowledge of solar astronomy well beyond Earth-based observations.

Shuttle-Mir

Phase 1 was a NASA program encompassing 11 space shuttle flights over a four-year period. It used existing assets - primarily U.S. shuttle orbiters and the Russian Space Station Mir - to build joint space experience and start joint scientific research.

Space Shuttle

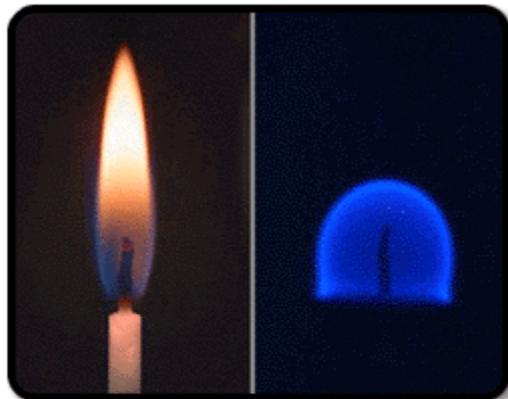

The Space Shuttle is a viable part of American History. Standing as one of NASA's foremost projects, the shuttle has accomplished many tasks that have enhanced the quality of life on Earth. View archives of the Shuttle program.

Do flames burn the same in zero-gravity as on Earth?

On Earth, a candle flame is subject to "buoyancy-induced flow," the movement of air around the flame. Gravity allows hotter air to be lighter and move upward in this way.

With the Candle Flame in Microgravity experiment, which took place on the Mir Space Station in 1996, scientists studied the ways in which combustion occurs and is sustained. The effects of gravity on burning rates, flame shape and spread, flame color, and the flickering of a pre-extinction flame were studied to better understand combustion in the microgravity environment.

The experiment found that candle flames take on a spherical shape in microgravity, rather than the elongated shape we see on Earth. On the ground, hotter, lighter gases rise, elongating the flame on a candle. In microgravity, the gases are not buoyant and, therefore, do not rise. They expand out from the flame equally, causing the spherical shape.
