

# PhoneCode 1.31

Windows 3.x Area Code and Time Zone Utility  
© Copyright 1992 dB Software. -- All Rights Reserved.

**Overview** -- PhoneCode is a Windows shareware program that will let you find an area code by city and state (city and province for Canada) or show the general location, time zone and major cities of any valid area code in the United States or in Canada. It is written in entirely in Microsoft's Visual Basic.

Some of the features of PhoneCode include:

- Ability to find information by area code or city and state.
- Support for all area codes in the United States and Canada.
- Finds time difference between home area code and area code selected.
- Includes updated data for new California area codes.
- Status bar showing data for home area code.

**Registration** -- Thank you for your registration of PhoneCode. Please read the enclosed license agreement for all the details. Additional copies of PhoneCode may be ordered if needed.

Single User License	\$5.00
Single User License Upgrade to Unlimited	\$20.00

For more information on ordering additional copies of PhoneCode, see ORDERFRM.WRI.

**Comments** -- I would appreciate and encourage any comments or questions that you might have about PhoneCode. (Including any errors or incorrect information.) Send them to:

Dan Begallie 621 Griffith Road Akron, Ohio 44312 (216)-745-2124	Prodigy: PHGP30A AOL: Marduk K CompuServe: 73120, 41

**Legal Info** -- There are no expressed or implied guarantees made regarding the use or misuse of this program. The user assumes the all risk of any incidental or consequential damages (including service or repair). In no event will the author be liable for any damages whatsoever arising out of the use or the inability to use this product.

A limited license is granted to copy and distribute the shareware version of PhoneCode for the evaluation use of others, as long as it is distributed without modification, complete with all files. No fee, charge or other compensation may be requested with these exceptions: Operators of electronic bulletin board systems may make PhoneCode available for downloading, so long as there is no specific charge for the download of PhoneCode. Vendors of user-supported or shareware software may distribute PhoneCode, so long as any duplication and handling fees do not exceed eight dollars, and notice is clearly given that such fees do not grant the evaluator a license to use PhoneCode beyond the evaluation period. The registered version of PhoneCode may not be freely distributed.

(See license agreement.)

**Installation** -- The easiest way to install PhoneCode is by using the Setup program. Since PhoneCode was written in Microsoft Visual Basic, it needs the file VBRUN100.DLL to run. If this file is not found in your Windows directory (usually something like C:\WINDOWS), PhoneCode will install it there for you. The Setup program will let you specify a directory to install the program files to, and then copy them there. If you have a previous version of PhoneCode in the specified directory, it will be erased. When the files are transferred, you will be given a choice of your Program Manager groups to install PhoneCode to. If you wish to add it yourself, select [none]. If you install the program manually, it is very important that all of the needed files are placed in the same directory. You can then run PhoneCode through the File Manager or add its icon to the Program Manager by selecting New from the File menu. For more information on installing PhoneCode manually, see README.TXT.

**Setup** -- The first time you run PhoneCode it will be necessary to enter your home data. This allows PhoneCode to take advantage of its time zone difference feature. Because of some changes in the program, this will have to be done even if you are upgrading from a previous version.

Upon entering the setup screen, select the state or province you live in. Next, select your city or the closest city from the city list box and click OK.

If the city you selected is not the actual city you live in, you can override it. To override the selected city, click on the **Override City** button on the setup form. This brings up a box where you can enter the name of your actual city if it's not among the ones listed. The same applies for the **Override Time Zone** button. If you live in an area code that lies in two different time zones, or the Setup program selected the wrong one, you can use this screen to select the correct one.

When all of the information appears correct, select **Save Data**. You must save the data for PhoneCode to operate properly

**Running** -- On-line help is provided for running the program. If you get stuck, press F1 or click on the help button if available.

**Credits** -- Special thanks go out to:

Jeng Long Jiang for the use of his Visual Basic tool library.  
Steven Tunick for Beta testing.  
Keith Crane for helping with the "fine tuning"  
Debbie Beeler for entering almost all the city and state data.

Windows and Visual Basic are both trademarks of the Microsoft Corporation.

**History** --

Version 1.31 -- Corrected Error with Florida area codes. Added registration screen. Added support for new Georgia area code. Made a few cosmetic adjustments. Improved initial setup procedure.

Version 1.30 -- Changed .INI file to conform to Windows standards. PhoneCode now remembers its

location on the screen when exited. Added Setup utility to aid in installation. About screen now tells windows mode, free memory and free user resources. Fixed area code problem with Newfoundland. Help file now to Windows standards

Version 1.24 -- PhoneCode now brings up the instance already running if it started again.

Version 1.23 -- Rewrote setup form to update info when changing home city or overriding time zones. Added help support for a few more controls. Added ability to override time zone and city before saving data for the first time.

Version 1.22 -- Fixed printing bug and updated Alaskan area code error. Fixed bug when exiting windows. Fixed some spelling errors.

Version 1.21 -- Added help screens. Fixed bug with "00" area codes and some of the Oklahoma data.

Version 1.20 -- Added time zone support and ability to override city and time zone in the setup. Fixed bug with Prince Edward Island and Nova Scotia area codes.

Version 1.10 -- Changed looks of program to a more 3-D appearance. Added support for Canadian area codes.

Version 1.00 -- Initial version and product concept.
