The DOM

This section covers the DOM interfaces supported by Adobe SVG Viewer. If an interface, method, or property is not listed here, then Adobe SVG Viewer does not yet support it. For brevity's sake, inherited interface members are listed only on base classes.

An embedded frame must first have keyboard focus for the event handlers `onkeydown`, `onkeyup`, and `onkeypress` to work.

Note: The script engine interface technology available on Netscape for the Macintosh does not support writable attributes on interfaces. To work around this limitation, Adobe SVG Viewer supports additional "get/set" methods for each DOM interface attribute. For cross-browser script compatibility you should always use these methods instead of the writable attributes listed below. For example, to read from and write to the attribute `nodeValue` on the `Node` interface, use the methods `getNodeValue` and `setnodeValue`, instead. To save space these methods were not listed below, but they are supported on all browsers for all DOM interface attributes.
