[Hyper-Ref 1.0 Stack]

Hyper-Ref 1.0 is a Hypercard (v2.0) stack that can be used to store
references that have been downloaded from a database such as Medline,
or ones you wish to enter yourself. With it you can load data files
into a stack with each reference stored on a separate card. The
delimiter for each reference within a text file to be uploaded into a
stack can be a return, tab, or one that you specify yourself. From
within a stack you can perform "AND", "OR" or "WORD/PHRASE" searches.
The searches can be printed, exported to a text file or saved to a new
stack. If you find any bugs, or have ideas for improvements let me know
(see the "About" menu for my e-mail address).
