

## The messages menu

There's a lot going on behind the scenes in this emulation; the messages menu lets you listen in on what's going on. Just make sure the disassembly window is showing, and enable whatever type of message you're interested in reading.

## The windows menu

Nothing tricky here, but this would be a good time to run over the default set of windows.

## Registers

A display of the 6502 registers, including the program counter and status flags

## Speed

Gives the emulated speed; 1 Mhz is about full speed.

## Messages

This window shows all of the messages you requested from the Messages menu, plus a few you probably didn't. When you have disassembly turned on, you see it here.
