Welcome to JunkMatcher - a cocktail-styled junk filter for Mail.app to help you fight spam!

JM has two basic components: the *Mail plugin* gathers emails from Mail.app for matching, and the *JunkMatcher.app* allows you to edit your tests, check what JM has done in the past, etc. JM also needs a few *rules* set up in Mail.app to know which emails it should examine.

The following process will install the Mail plugin and the necessary Mail rules for you. You can also reinstall them by choosing the "Reinstall..." menu items from the JunkMatcher menu.

Visit <http://junkmatcher.sourceforge.net> for more information. See Release Notes.rtf in this package for the changes in this version.
