

Congratulations, You're Done!

After clicking on the "Finish" button, JunkMatcher will present you with some of the following windows (you can configure JM to open them when it starts):

- * **Analyzer Window:** You can load in emails, examine them, and build/test/adjust various tests here.
- * **Log Window:** You can check what JunkMatcher has done in the past here. You can also correct JM by checking/unchecking the "Junk?" check box in the log table.
- * **Whitelist Window:** You can manage your whitelist (a list of senders whose emails you want to exempt from matching) here.
- * **Sites Window:** This window shows you the websites JunkMatcher has collected from the identified junk emails.

About the Default Settings and Patterns

Although the default settings and patterns should work reasonably well for many users, they are configured based on the author's own needs. Please make sure you adjust them to suit *your* needs (especially if you subscribe to many mailing lists).
