

Server Status

The Server Status display provides a high-level view of file transfer activity since the server was started. Overall server statistics are displayed for both FTP and Web File Manager interfaces. For specific details about active user logins, see the "Active Users" window. Overall statistics regarding the number of user logins and file transfer statistics are tracked since the server daemon was last started. Stopping and restarting the server daemon (or performing a complete server restart) will therefore reset these statistics, but quitting the Rumpus control application will not.

Statistics are obtained by periodically polling the Rumpus server daemon. The overhead involved in refreshing the statistics is low, but the interval is selectable, allowing you to minimize the number of server hits needed to maintain the display. When you are actively monitoring server usage, set the "Refresh Every" pop-up menu to 1 or 5 seconds, increasing the frequency of the updates. On the other hand, if the status display is generally left open for occasional monitoring, reduce the load on the server by setting the "Refresh Every" pop-up to 5 minutes or an hour.

FTP Statistics

Successful Logins

The number of times users have successfully connected to the server and entered a correct username and password (including anonymous users).

Failed Logins

The number of times users have established a connection to the server but failed to log on. Failures may be due to incorrect username and password, denied service due to maximum connections or blocked client address, or other errors.

Successful Transfers

The total number of files that have been successfully sent or received.

Failed Transfers

The number of times a file transfer has been attempted but did not complete for any reason.

Bytes Uploaded

The total number of bytes received by the FTP server while accepting file uploads from remote users.

Bytes Downloaded

The total number of bytes sent by the FTP server while satisfying file requests from remote users.

WFM Statistics

Transactions

The total number of Web "hits", or client requests, made of the Rumpus Web server. This figure includes file uploads, downloads, directory listings and all supplemental pages and images served.

Directory Listings

The number of times the "listings" page has been served by Rumpus.

Files Uploaded

The number of file uploads accepted via the Rumpus WFM.

Files Downloaded

The number of file download requests sent via the Rumpus WFM.

Bytes Uploaded

The total size of all files uploaded to the server through the WFM.

Bytes Downloaded

The total size of all file downloads sent to clients through the WFM.
