

## Viewing Log Files

Rumpus maintains several different logs, each with a different purpose. The most recent entries recorded in each log can be easily reviewed within the Rumpus control application, though you may also want to use a full log parser for more comprehensive analysis. The ability to quickly and easily review log files within Rumpus isn't intended to replace detailed log analysis, but rather to provide a simple way to review recent activity.

To view any of the available Rumpus log files, simply select the file from the "Viewing Log" pop-up menu. To refresh the display and see new entries, click the reload button just to the right of the pop-up, and to delete the existing log file, essentially clearing it out for new entries, click the trash can icon. When the "Debug" log is selected, you can choose the level of log messages recorded using the "Debug Level" pop-up menu.

Note that some of the log files can grow to be quite large, and the log file display is not designed to display more than a few hundred lines. Instead, the log file display will always load the most recent 20k or so of log information. To view more of the log, open the file in a text editor, spread sheet, database or other log analysis application.
