

ImageStream Demonstration Application

Welcome to the ImageStream demonstration application. ImageStream by VisualTools is a high-performance graphics file conversion component that provides complete and accurate importing, viewing, translation, printing, and exporting of both vector and bitmapped images.

ImageStream can be used as a Visual Basic custom control in VisualBasic, Visual C++, Borland C++, and other Windows-based development environments. This demonstration application was created using ImageStream in VisualBasic. However, this demonstration is a standalone application and does not require VisualBasic to be loaded on your system.

The demonstration files for ImageStream are compressed in the file ISDEMO.ZIP.

To install this demonstration application on your system, perform the following steps:

1. Copy the file ISDEMO.ZIP to the directory in which you want to install the demonstration application and its associated files.

You may want to create a new directory to contain the files for this application. After you have finished using the demonstration, the application and its associated files can be easily deleted by deleting this directory.

2. From a DOS prompt, enter the command:
PKUNZIP ISDEMO.ZIP

To launch the demonstration application:

1. Return to Windows and launch the File Manager.
2. In the File Manager, display the directory containing the ImageStream application files that you just decompressed.
3. Double click the file DEMOALL.EXE

The demonstration application launches and is ready for use. The application allows you to import, translate, export, and print graphic images from your system using the ImageStream filters. ImageStream contains 26 import and 20 export filters. In this application, filters are provided for importing only BMP, DXF, GIF, JPG, PCD, and TIF files and exporting only BMP, CGM, CTM, DXF, GEM, GIF, PCX, TGA, and TIF files.
