Overview

What is the quickest and easiest way to develop Windows Help files?

The answer is Visual Help Pro -- the completely integrated help development environment. Visual Help enables you to produce your help files and on-line documentation quickly and easily. You may have used some of the other help authoring tools that require you to type in special codes and use a separately purchased word processor. But when you're using Visual Help, development time can be cut down from days to just minutes!

The real advantage of Visual Help is its object oriented interface. This is most evident whenever editing the contents of a particular topic; an area you'll be spending 90% of your time. Whenever you edit a topic, it is opened in its own special "Design Window" containing its own toolbar and status line. You can then add paragraphs, headings, bullets, jumps, bitmaps, sound, video, and other objects by dragging them off the toolbox and dropping them onto topic window. All properties of each object such as style, action, and links can be easily changed within the topic window by clicking the right mouse button to display the popup Menu Assistant. This floating menu provides instant access to the most common commands and properties -- a definite time saver.

New Features

- **Spell Checker** - Proof your help topics using the built in spell checker, with support to check one topic at a time or all topics within the project.
- **Search and Replace** - Search for text within your document or just find a topic within your project.
- **Bold and Italics** -Format the text within your project in either bold, italics, or both.
- **Object Alignment** -Align your text or graphics in either left, centered, or right justifications.
- **Improved Topic Design Window** -New toolbar buttons for the popup menu, text/graphic alignment, bold, italics, as well as a new context ID display field.
- **Improved Glossary Window** -Added window selection list allows paragraph jumps to secondary windows, and line feeds are supported within glossary definitions.
- **Table Object** - Add elastic or fixed width tables to your help file, use them to present data or just to organize the contents of your help document.
- **Outline Object** - Create cascading outlines with branches and leaves, to give your help files the maximum screen real-estate, and the look of professional help documents.
- **New User's Guide** -Provides an in depth description of all areas of functionality, complete with screen shots, diagrams, tables, and tutorials.

Release Notes

If you are using a high resolution display driver with more than 256 colors, it may be necessary to change your configuration to use a lower resolution driver such as 256 or 16 colors if you should encounter any problems.

Questions

Product Support for Visual Help is available to registered users through the WinSIG Bulletin Board System and through CompuServe. Please note *Visual Help Pro Technical Support* some where at the beginning of all your messages.

WinSIG BBS

(714) 363-9802 2400/9600/14400 N-8-1

Please direct your questions to the sysop by selecting 'C' for comments from the main menu.

CompuServe

Please direct your questions to:

WinWare Inc.

CompuServe ID# 70272,1656

Internet

For technical support via Internet, write to 70272.1656@compuserve.com.
